※When selecting Re-start mode while operating, cut off the power and turn it on again.

※Delay Time: Approx. 30ms

※t: ON time for input signal

E.g.) When the signal of which input signal is 100Hz (ON: OFF=1:1) is inserted, $1/100\text{Hz}=10\text{ms}$ (ON=5ms, OFF=5ms).

Since input signal's on time is 5ms, therefore, total delay time for output waveform becomes approx. 35ms(5ms+30ms).

※You should consider total delay time first when selecting the division. When division time is shorter than total delay time, output TR keeps staying ON state.

■ Proper Usage

- Follow instructions in 'Cautions during Use'. Otherwise, It may cause unexpected accidents.
- Since the power for external sensor is without the output short over current protection circuit, do not short circuit 12V and 0V terminals.
- Use the product, 0.1 sec after supplying power.
- When supplying or turning off the power, use a switch or etc. to avoid chattering.
- Install a power switch or circuit breaker in the easily accessible place for supplying or disconnecting the power.
- Keep away from high voltage lines or power lines to prevent inductive noise.
 - In case installing power line and input signal line closely, use line filter or varistor at power line and shielded wire at input signal line.
 - Do not use near the equipment which generates strong magnetic force or high frequency noise.
- This unit may be used in the following environments.
 - Indoors (in the environment condition rated in 'Specifications')
 - Altitude max. 2,000m
 - Pollution degree 2
 - Installation category II
