

Design Guide
VLT ${ }^{\circledR}$ AutomationDrive

## Contents

1 How to Read this Design Guide ..... 7
1.1.1 Symbols ..... 7
1.1.2 Abbreviations ..... 7
1.1.3 Definitions ..... 8
2 Safety and Conformity ..... 11
2.1 Safety Precautions ..... 11
3 Introduction to FC 300 ..... 15
3.1 Product Overview ..... 15
3.2.1 Control Principle ..... 17
3.2.2 FC 300 Controls ..... 17
3.2.3 FC 301 vs. FC 302 Control Principle ..... 18
3.2.4 Control Structure in VVC ${ }^{\text {plus }}$ Advanced Vector Control ..... 19
3.2.5 Control Structure in Flux Sensorless (FC 302 only) ..... 20
3.2.6 Control Structure in Flux with Motor Feedback ..... 21
3.2.7 Internal Current Control in VVC ${ }^{\text {plus }}$ Mode ..... 22
3.2.8 Local (Hand On) and Remote (Auto On) Control ..... 22
3.3 Reference Handling ..... 23
3.3.1 Reference Limits ..... 24
3.3.2 Scaling of Preset References and Bus References ..... 25
3.3.3 Scaling of Analog and Pulse References and Feedback ..... 25
3.3.4 Dead Band Around Zero ..... 26
3.4 PID Control ..... 30
3.4.1 Speed PID Control ..... 30
3.4.2 Tuning PID Speed Control ..... 31
3.4.3 Process PID Control ..... 32
3.4.4 Example of Process PID Control ..... 34
3.4.5 Ziegler Nichols Tuning Method ..... 35
3.5 General Aspects of EMC ..... 37
3.5.1 General Aspects of EMC Emissions ..... 37
3.5.2 EMC Test Results ..... 38
3.5.3 Emission Requirements ..... 39
3.5.4 Immunity Requirements ..... 40
3.6.1 PELV - Protective Extra Low Voltage ..... 41
3.8 Brake Functions in FC 300 ..... 42
3.8.1 Mechanical Holding Brake ..... 42
3.8.2 Dynamic Braking ..... 43
3.8.3 Selection of Brake Resistor ..... 43
3.9.1 Mechanical Brake Control ..... 45
3.9.2 Hoist Mechanical Brake ..... 46
3.9.3 Brake Resistor Cabling ..... 47
3.10 Smart Logic Controller ..... 47
3.11 Extreme Running Conditions ..... 49
3.11.1 Motor Thermal Protection ..... 49
3.12 Safe Stop of FC 300 ..... 51
3.12.2 Installation of External Safety Device in Combination with MCB 112 ..... 56
3.12.3 Safe Stop Commissioning Test ..... 57
3.13 Certificates ..... 58
4 FC 300 Selection ..... 60
4.1 Electrical Data - 200-240V ..... 60
4.2 Electrical Data - 380-500V ..... 63
4.3 Electrical Data - 525-600V ..... 71
4.4 Electrical Data - 525-690V ..... 74
4.5 General Specifications ..... 85
4.7.1 Acoustic Noise ..... 90
4.8.1 du/dt Conditions ..... 91
4.9 Special Conditions ..... 94
4.9.1 Manual Derating ..... 94
4.6.1.1 Derating for Running at Low Speed ..... 94
4.9.2 Automatic Derating ..... 94
5 How to Order ..... 95
5.1.1 Ordering from Type Code ..... 95
5.1.2 Drive Configurator ..... 95
5.2.1 Ordering Numbers: Options and Accessories ..... 99
5.2.2 Ordering Numbers: Spare Parts ..... 100
5.2.3 Ordering Numbers: Accessory Bags ..... 100
5.2.4 Ordering Numbers: High Power Kits ..... 101
5.2.5 Ordering Numbers: Brake Resistors 10\% ..... 101
5.2.6 Ordering Numbers: Brake Resistors 40\% ..... 106
5.2.7 Flat Packs ..... 111
5.2.8 Ordering Numbers: Harmonic Filters ..... 113
5.2.9 Ordering Numbers: Sine Wave Filter Modules, 200-500 VAC ..... 115
5.2.10 Ordering Numbers: Sine-Wave Filter Modules, 525-690 VAC ..... 116
5.2.11 Ordering Numbers: du/dt Filters, 380-480/500V AC ..... 116
5.2.12 Ordering Numbers: du/dt Filters, 525-690V AC ..... 116
6 Mechanical Installation - Frame Size A, B and C ..... 117
6.1.1 Safety Requirements of Mechanical Installation ..... 117
6.1.2 Mechanical Mounting ..... 120
7 Mechanical Installation - Frame size D, E and F ..... 121
7.1 Pre-installation ..... 121
7.1.1 Planning the Installation Site ..... 121
7.1.2 Receiving the Frequency Converter ..... 121
7.1.3 Transportation and Unpacking ..... 121
7.1.4 Lifting ..... 121
7.1.5 Mechanical Dimensions ..... 123
7.1.6 Mechanical Dimensions, 12-Pulse Units ..... 130
7.2 Mechanical Installation ..... 133
7.2.1 Tools Needed ..... 133
7.2.2 General Considerations ..... 133
7.2.3 Terminal Locations - Frame size D ..... 135
7.2.4 Terminal Locations - Frame size E ..... 137
7.2.5 Terminal Locations - Frame size F ..... 142
7.2.6 Terminal Locations, F8-F13-12-Pulse ..... 146
7.2.7 Cooling and Airflow ..... 151
7.2.8 Installation on the Wall - IP21 (NEMA 1) and IP54 (NEMA 12) Units ..... 152
7.2.9 Gland/Conduit Entry - IP21 (NEMA 1) and IP54 (NEMA12) ..... 153
7.2.10 Gland/Conduit Entry, 12-Pulse - IP21 (NEMA 1) and IP54 (NEMA12) ..... 154
7.2.11 IP21 Drip Shield Installation (Frame size D1 and D2 ) ..... 156
8 Electrical Installation ..... 157
8.1 Connections- Frame Sizes A, B and C ..... 157
8.1.1 Removal of Knockouts for Extra Cables ..... 158
8.1.2 Connection to Mains and Earthing ..... 158
8.1.3 Motor Connection ..... 160
8.1.4 Relay Connection ..... 168
8.2 Connections - Frame Sizes D, E and F ..... 169
8.2.1 Torque ..... 169
8.2.2 Power Connections ..... 169
8.2.3 Power Connections 12-Pulse Drives ..... 180
8.2.4 Shielding against Electrical Noise ..... 189
8.2.5 External Fan Supply ..... 189
8.3 Fuses and Circuit Breakers ..... 190
8.3.1 Recommendations ..... 190
8.3.2 CE Compliance ..... 191
8.4 Disconnectors and Contactors ..... 203
8.4.1 Mains Disconnectors ..... 203

Contents
8.4.4 F-Frame Mains Contactors ..... 205
8.5 Additional Motor Information ..... 206
8.5.1 Motor Cable ..... 206
8.5.2 Motor Thermal Protection ..... 206
8.5.3 Parallel Connection of Motors ..... 206
8.5.5 Motor Bearing Currents ..... 208
8.6 Control Cables and Terminals ..... 209
8.6.1 Access to Control Terminals ..... 209
8.6.2 Control Cable Routing ..... 209
8.6.3 Control Terminals ..... 210
8.6.4 Switches S201, S202, and S801 ..... 211
8.6.5 Electrical Installation, Control Terminals ..... 211
8.6.6 Basic Wiring Example ..... 212
8.6.7 Electrical Installation, Control Cables ..... 213
8.6.8 12-Pulse Control Cables ..... 215
8.6.9 Relay Output ..... 218
8.6.10 Brake Resistor Temperature Switch ..... 218
8.7 Additional Connections ..... 218
8.7.1 DC Bus Connection ..... 218
8.7.2 Load Sharing ..... 218
8.7.3 Installation of Brake Cable ..... 219
8.7.4 How to Connect a PC to the Frequency Converter ..... 219
8.7.5 The FC 300 PC Software ..... 219
8.8.1 High Voltage Test ..... 220
8.8.2 Earthing ..... 220
8.8.3 Safety Earth Connection ..... 220
8.9 EMC-correct Installation ..... 220
8.9.1 Electrical Installation - EMC Precautions ..... 220
8.9.2 Use of EMC-Correct Cables ..... 222
8.9.3 Earthing of Screened Control Cables ..... 224
8.9.4 RFI Switch ..... 224
8.10.1 Mains Supply Interference/Harmonics ..... 225
8.10.2 The Effect of Harmonics in a Power Distribution System ..... 225
8.10.3 Harmonic Limitation Standards and Requirements ..... 226
8.10.4 Harmonic Mitigation ..... 226
8.10.5 Harmonic Calculation ..... 226
8.11 Residual Current Device - FC 300 DG ..... 226
8.12 Final Setup and Test ..... 227
9 Application Examples ..... 228
9.1.1 Encoder Connection ..... 233
9.1.2 Encoder Direction ..... 233
9.1.3 Closed Loop Drive System ..... 233
9.1.4 Programming of Torque Limit and Stop ..... 233
10 Options and Accessories ..... 235
10.1.1 Mounting of Option Modules in Slot A ..... 235
10.1.2 Mounting of Option Modules in Slot B ..... 235
10.1.3 Mounting of Options in Slot C ..... 236
10.2 General Purpose Input Output Module MCB 101 ..... 236
10.2.1 Galvanic Isolation in the MCB 101 ..... 236
10.2.2 Digital Inputs - Terminal X30/1-4: ..... 238
10.2.3 Analog Inputs - Terminal X30/11, 12: ..... 238
10.2.4 Digital Outputs - Terminal X30/6, 7: ..... 238
10.2.5 Analog Output - Terminal X30/8: ..... 238
10.3 Encoder Option MCB 102 ..... 239
10.4 Resolver Option MCB 103 ..... 240
10.5 Relay Option MCB 105 ..... 241
10.6 24V Back-Up Option MCB 107 ..... 243
10.7 MCB 112 PTC Thermistor Card ..... 244
10.8 MCB 113 Extended Relay Card ..... 246
10.9 Brake Resistors ..... 247
10.10 LCP Panel Mounting Kit ..... 247
10.11 IP21/IP 4X/ TYPE 1 Enclosure Kit ..... 248
10.12 Mounting Bracket for Frame Size A5, B1, B2, C1 and C2 ..... 251
10.13 Sine-wave Filters ..... 253
10.14 High Power Options ..... 253
10.14.1 Frame Size F Options ..... 253

Index ..... 275

## 1 How to Read this Design Guide

This Design Guide will introduce all aspects of your FC 300.

## Available literature for FC 300

- The VLT AutomationDrive Operating Instructions MG.33.AX.YY provide the neccessary information for getting the drive up and running.
- The VLT AutomationDrive High Power Operating Instructions MG.33.UX.YY
- The VLT AutomationDrive Design Guide MG. 33.BX.YY entails all technical information about the drive and customer design and applications.
- The VLT AutomationDrive Programming Guide MG.33.MX.YY provides information on how to programme and includes complete parameter descriptions.
- The VLT AutomationDrive Profibus Operating Instructions MG.33.CX.YY provide the information required for controlling, monitoring and programming the drive via a Profibus fieldbus.
- The VLT AutomationDrive DeviceNet Operating Instructions MG.33.DX.YY provide the information required for controlling, monitoring and programming the drive via a DeviceNet fieldbus.
$X=$ Revision number
$\mathrm{YY}=$ Language code

Danfoss Drives technical literature is also available online at www.danfoss.com/BusinessAreas/DrivesSolutions/ Documentations/Technical+Documentation.

### 1.1.1 Symbols

Symbols used in this guide.

## NOTE

Indicates something to be noted by the reader.

## ACAUTION

Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury or equipment damage.

## AWARNING

Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

## * Indicates default setting

### 1.1.2 Abbreviations

| Alternating current | AC |
| :---: | :---: |
| American wire gauge | AWG |
| Ampere/AMP | A |
| Automatic Motor Adaptation | AMA |
| Current limit | lıim |
| Degrees Celsius | ${ }^{\circ} \mathrm{C}$ |
| Direct current | DC |
| Drive Dependent | D-TYPE |
| Electro Magnetic Compatibility | EMC |

| Gram | 9 |
| Hertz | Hz |
| Horsepower | hp |
| Kilohertz | kHz |
| Local Control Panel | LCP |
| Meter | m |
| Millihenry Inductance | mH |
| Milliampere | mA |
| Millisecond | ms |
| Minute | min |
| Motion Control Tool | MCT |
| Nanofarad | nF |
| Newton Meters | Nm |
| Nominal motor current | $\mathrm{I}_{\mathrm{M}, \mathrm{N}}$ |
| Nominal motor frequency | $\mathrm{f}_{\mathrm{M}, \mathrm{N}}$ |
| Nominal motor power | $\mathrm{P}_{\mathrm{M}, \mathrm{N}}$ |
| Nominal motor voltage | $\mathrm{U}_{\mathrm{M}, \mathrm{N}}$ |
| Parameter | par. |
| Protective Extra Low Voltage | PELV |
| Printed Circuit Board | PCB |
| Rated Inverter Output Current | IInv |
| Revolutions Per Minute | RPM |
| Regenerative terminals | Regen |
| Second | sec. |
| Synchronous Motor Speed | $\mathrm{n}_{\mathrm{s}}$ |
| Torque limit | TıIM |
| Volts | V |
| The maximum output current | IvLt,max |
| The rated output current supplied by the frequency converter | Ivit,N |

### 1.1.3 Definitions

## Frequency converter:

## Coast

The motor shaft is in free mode. No torque on motor.

## Imax

The maximum output current.
In
The rated output current supplied by the frequency converter.

## $\underline{U}_{\text {MAX }}$

The maximum output voltage.

## Input:

Control command
Start and stop the connected motor by means of LCP and the digital inputs.
Functions are divided into two groups.
Functions in group 1 have higher priority than functions in group 2.

| Group 1 | Reset, Coasting stop, Reset and Coasting stop, <br> Quick-stop, DC braking, Stop and the "Off" key. |
| :--- | :--- |
| Group 2 | Start, Pulse start, Reversing, Start reversing, Jog <br> and Freeze output |

## Motor:

foog
The motor frequency when the jog function is activated (via digital terminals).
$f_{M}$
Motor frequency. Output from the frequency converter. Output frequency is related to the shaft speed on motor depending on number of poles and slip frequency.

## $f_{\text {MAX }}$

The maximum output frequency the frequency converter applies on its output. The maximum output frequency is set in limit par. 4-12, 4-13 and 4-19.
$f_{\text {min }}$
The minimum motor frequency from frequency converter. Default 0 Hz .
$f_{M, N}$
The rated motor frequency (nameplate data).
IM
$\overline{T h e}$ motor current.
$\mathrm{Im}_{\mathrm{M}, \mathrm{N}}$
The rated motor current (nameplate data).
$\mathrm{n}_{\mathrm{M}, \mathrm{N}}$
The rated motor speed (nameplate data).
$\mathrm{n}_{\mathrm{s}}$
Synchronous motor speed
$n_{s}=\frac{2 \times \text { par. } 1-23 \times 60 s}{\text { par. } 1-39}$
$\mathrm{P}_{\mathrm{M}, \mathrm{N}}$
The rated motor power (nameplate data).
$\mathrm{T}_{\mathrm{M}, \mathrm{N}}$
The rated torque (motor).
$\mathrm{U}_{\mathrm{M}}$
The instantaneous motor voltage.
$U_{M, N}$
The rated motor voltage (nameplate data).

Break-away torque

n
The efficiency of the frequency converter is defined as the ratio between the power output and the power input.

## Start-disable command

A stop command belonging to the group 1 control commands - see this group.

## Stop command

See Control commands.

## References:

Analog Reference
An analog signal applied to input 53 or 54 . The signal can be either Voltage 0-10V (FC 301 and FC 302) or $-10-+10 \mathrm{~V}$ (FC 302). Current signal 0-20 mA or 4-20 mA.

## Binary Reference

A signal applied to the serial communication port (RS-485 term 68-69).

## Preset Reference

A defined preset reference to be set from $-100 \%$ to $+100 \%$ of the reference range. Selection of eight preset references via the digital terminals.

## Pulse Reference

A pulse reference applied to term 29 or 33 , selected by par. 5-13 or 5-15 [32]. Scaling in par. group 5-5*.

## Refmax

Determines the relationship between the reference input at $100 \%$ full scale value (typically $10 \mathrm{~V}, 20 \mathrm{~mA}$ ) and the resulting reference. The maximum reference value set in 3-03 Maximum Reference.

## Refmin

Determines the relationship between the reference input at $0 \%$ value (typically $0 \mathrm{~V}, 0 \mathrm{~mA}, 4 \mathrm{~mA}$ ) and the resulting reference. The minimum reference value set in 3-02 Minimum Reference.

## Miscellaneous:

Analog Inputs
The analog inputs are used for controlling various
functions of the frequency converter.
There are two types of analog inputs:
Current input, $0-20 \mathrm{~mA}$ and $4-20 \mathrm{~mA}$
Voltage input, 0-10V DC (FC 301)
Voltage input, -10-+10V DC (FC 302).
Analog Outputs
The analog outputs can supply a signal of $0-20 \mathrm{~mA}$, 4-20mA.

## Automatic Motor Adaptation, AMA

AMA algorithm determines the electrical parameters for the connected motor at standstill.

## Brake Resistor

The brake resistor is a module capable of absorbing the brake power generated in regenerative braking. This regenerative braking power increases the intermediate circuit voltage and a brake chopper ensures that the power is transmitted to the brake resistor.

## CT Characteristics

Constant torque characteristics used for all applications such as conveyor belts, displacement pumps and cranes.

## Digital Inputs

The digital inputs can be used for controlling various functions of the frequency converter.

## Digital Outputs

The frequency converter features two Solid State outputs that can supply a 24 V DC (max. 40 mA ) signal.

## DSP

Digital Signal Processor.

## ETR

Electronic Thermal Relay is a thermal load calculation based on present load and time. Its purpose is to estimate the motor temperature.

## Hiperface ${ }^{\circ}$

Hiperface ${ }^{\circ}$ is a registered trademark by Stegmann.

## Initialising

If initialising is carried out (14-22 Operation Mode), the frequency converter returns to the default setting.

Intermittent Duty Cycle
An intermittent duty rating refers to a sequence of duty cycles. Each cycle consists of an on-load and an off-load period. The operation can be either periodic duty or nonperiodic duty.

## LCP

The Local Control Panel makes up a complete interface for control and programming of the frequency converter. The control panel is detachable and can be installed up to 3 metres from the frequency converter, i.e. in a front panel by means of the installation kit option.

NLCP
Numerical Local Control Panel interface for control and programming of frequency converter. The display is numerical and the panel is basically used for display process values. The NLCP has no storing and copy function.

Isb
Least significant bit.
msb
Most significant bit.
MCM
Short for Mille Circular Mil, an American measuring unit for cable cross-section. $1 \mathrm{MCM}=0.5067 \mathrm{~mm}^{2}$.

## On-line/Off-line Parameters

Changes to on-line parameters are activated immediately after the data value is changed. Changes to off-line parameters are not activated until you enter [OK] on the LCP.

Process PID
The PID regulator maintains the desired speed, pressure, temperature, etc. by adjusting the output frequency to match the varying load.

## PCD

Process Data

## Pulse Input/Incremental Encoder

An external digital sensor used for feedback information of motor speed and direction. Encoders are used for high speed accuracy feedback and in high dynamic applications. The encoder connection is either via term 32 and 32 or encoder option MCB 102.

RCD
Residual Current Device.
Set-up
You can save parameter settings in four Set-ups. Change between the four parameter Set-ups and edit one Set-up, while another Set-up is active.

## SFAVM

Switching pattern called Stator Flux oriented Asynchronous Vector Modulation (14-00 Switching Pattern).

Slip Compensation
The frequency converter compensates for the motor slip by giving the frequency a supplement that follows the
measured motor load keeping the motor speed almost constant.

## Smart Logic Control (SLC)

The SLC is a sequence of user defined actions executed when the associated user defined events are evaluated as true by the Smart Logic Controller. (Par. group 13-** Smart Logic Control (SLC).

## STW

Status Word

## FC Standard Bus

Includes RS -485 bus with FC protocol or MC protocol. See 8-30 Protocol.

## Thermistor:

A temperature-dependent resistor placed where the temperature is to be monitored (frequency converter or motor).

## THD

Iotal Harmonic Distortion state the total contribution of harmonic.

## Trip

A state entered in fault situations, e.g. if the frequency converter is subject to an over-temperature or when the frequency converter is protecting the motor, process or mechanism. Restart is prevented until the cause of the fault has disappeared and the trip state is cancelled by activating reset or, in some cases, by being programmed to reset automatically. Trip may not be used for personal safety.

Trip Locked
A state entered in fault situations when the frequency converter is protecting itself and requiring physical intervention, e.g. if the frequency converter is subject to a short circuit on the output. A locked trip can only be cancelled by cutting off mains, removing the cause of the fault, and reconnecting the frequency converter. Restart is prevented until the trip state is cancelled by activating reset or, in some cases, by being programmed to reset automatically. Trip may not be used for personal safety.

## VT Characteristics

Variable torque characteristics used for pumps and fans.
VVC plus
If compared with standard voltage/frequency ratio control, Voltage Vector Control (VVC ${ }^{\text {plus }}$ ) improves the dynamics and the stability, both when the speed reference is changed and in relation to the load torque.

## $60^{\circ} \mathrm{AVM}$

Switching pattern called $60^{\circ}$ Asynchronous Vector Modulation (14-00 Switching Pattern).

## Power Factor

The power factor is the relation between $I_{1}$ and $I_{\text {rms. }}$

Power factor $=\frac{\sqrt{3} \times U \times I_{1} \cos \varphi}{\sqrt{3} \times U \times I_{R M S}}$
The power factor for 3-phase control:
$=\frac{/ 1 \times \cos \varphi 1}{I_{R M S}}=\frac{I_{1}}{I_{R M S}}$ since $\cos \varphi 1=1$
The power factor indicates to which extent the frequency converter imposes a load on the mains supply. The lower the power factor, the higher the lrms for the same kW performance.

$$
I_{R M S}=\sqrt{I_{1}^{2}+I_{5}^{2}+I_{7}^{2}}+. .+I_{n}^{2}
$$

In addition, a high power factor indicates that the different harmonic currents are low.
All Danfoss frequency converters have built-in DC coils in the $D C$ link to have a high power factor and to reduce the THD on the main supply.

## 2 Safety and Conformity

### 2.1 Safety Precautions

## AWARNING

The voltage of the frequency converter is dangerous whenever connected to mains. Incorrect installation of the motor, frequency converter or fieldbus may cause death, serious personal injury or damage to the equipment. Consequently, the instructions in this manual, as well as national and local rules and safety regulations, must be complied with.

## Safety Regulations

1. The mains supply to the frequency converter must be disconnected whenever repair work is to be carried out. Check that the mains supply has been disconnected and that the necessary time has elapsed before removing motor and mains supply plugs.
2. The [OFF] button on the control panel of the frequency converter does not disconnect the mains supply and consequently it must not be used as a safety switch.
3. The equipment must be properly earthed, the user must be protected against supply voltage and the motor must be protected against overload in accordance with applicable national and local regulations.
4. The earth leakage current exceeds 3.5 mA .
5. Protection against motor overload is not included in the factory setting. If this function is desired, set 1-90 Motor Thermal Protection to data value ETR trip 1 [4] or data value ETR warning 1 [3].
6. Do not remove the plugs for the motor and mains supply while the frequency converter is connected to mains. Check that the mains supply has been disconnected and that the necessary time has elapsed before removing motor and mains plugs.
7. Please note that the frequency converter has more voltage sources than L1, L2 and L3, when load sharing (linking of DC intermediate circuit) or external 24 V DC are installed. Check that all voltage sources have been disconnected and that the necessary time has elapsed before commencing repair work.

## Warning against unintended start

1. The motor can be brought to a stop by means of digital commands, bus commands, references or
a local stop, while the frequency converter is connected to mains. If personal safety considerations (e.g. risk of personal injury caused by contact with moving machine parts following an unintentional start) make it necessary to ensure that no unintended start occurs, these stop functions are not sufficient. In such cases the mains supply must be disconnected or the Safe Stop function must be activated.
2. The motor may start while setting the parameters. If this means that personal safety may be compromised (e.g. personal injury caused by contact with moving machine parts), motor starting must be prevented, for instance by use of the Safe Stop function or secure disconnection of the motor connection.
3. A motor that has been stopped with the mains supply connected, may start if faults occur in the electronics of the frequency converter, through temporary overload or if a fault in the power supply grid or motor connection is remedied. If unintended start must be prevented for personal safety reasons (e.g. risk of injury caused by contact with moving machine parts), the normal stop functions of the frequency converter are not sufficient. In such cases the mains supply must be disconnected or the Safe Stop function must be activated.

## NOTE

When using the Safe Stop function, always follow the instructions in the section Safe Stop of the VLT AutomationDrive Design Guide.
4. Control signals from, or internally within, the frequency converter may in rare cases be activated in error, be delayed or fail to occur entirely. When used in situations where safety is critical, e.g. when controlling the electromagnetic brake function of a hoist application, these control signals must not be relied on exclusively.

## AWARNING

## High Voltage

Touching the electrical parts may be fatal - even after the equipment has been disconnected from mains.
Also make sure that other voltage inputs have been disconnected, such as external 24 V DC, load sharing (linkage of DC intermediate circuit), as well as the motor connection for kinetic back up.
Systems where frequency converters are installed must, if necessary, be equipped with additional monitoring and protective devices according to the valid safety regulations, e.g law on mechanical tools, regulations for the prevention of accidents etc. Modifications on the frequency converters by means of the operating software are allowed.

## NOTE

Hazardous situations shall be identified by the machine builder/ integrator who is responsible for taking necessary preventive means into consideration. Additional monitoring and protective devices may be included, always according to valid national safety regulations, e.g. law on mechanical tools, regulations for the prevention of accidents.

## NOTE

Crane, Lifts and Hoists:
The controlling of external brakes must always have a redundant system. The frequency converter can in no circumstances be the primary safety circuit. Comply with relevant standards, e.g.
Hoists and cranes: IEC 60204-32
Lifts: EN 81

## Protection Mode

Once a hardware limit on motor current or dc-link voltage is exceeded the frequency converter will enter "Protection mode". "Protection mode" means a change of the PWM modulation strategy and a low switching frequency to minimize losses. This continues 10 sec after the last fault and increases the reliability and the robustness of the frequency converter while re-establishing full control of the motor.
In hoist applications "Protection mode" is not usable because the frequency converter will usually not be able to leave this mode again and therefore it will extend the time before activating the brake - which is not recommendable. The "Protection mode" can be disabled by setting 14-26 Trip Delay at Inverter Fault to zero which means that the frequency converter will trip immediately if one of the hardware limits is exceeded.

## NOTE

It is recommended to disable protection mode in hoisting applications (14-26 Trip Delay at Inverter Fault $=0$ )

The DC link capacitors remain charged after power has been disconnected. Be aware that there may be high voltage on the DC link even when the Control Card LEDs are turned off. A red LED is mounted on a circuit board inside the drive to indicate the DC bus voltage. The red LED will stay lit until the DC link is 50 Vdc or lower. To avoid electrical shock hazard, disconnect the frequency converter from mains before carrying out maintenance. When using a PM-motor, make sure it is disconnected. Before doing service on the frequency converter wait at least the amount of time indicated below:

| Voltage | Power | Waiting Time |
| :--- | :--- | :--- |
| $380-500 \mathrm{~V}$ | $0.25-7.5 \mathrm{~kW}$ | 4 minutes |
|  | $11-75 \mathrm{~kW}$ | 15 minutes |
|  | $90-200 \mathrm{~kW}$ | 20 minutes |
|  | $250-800 \mathrm{~kW}$ | 40 minutes |
| $525-690 \mathrm{~V}$ | $11-75 \mathrm{~kW}$ (frame <br> size B and C) | 15 minutes |
|  | $37-315 \mathrm{~kW}$ (frame <br> size D) | 20 minutes |
|  | $355-1000 \mathrm{~kW}$ | 30 minutes |

### 2.2.1 Disposal Instruction

Equipment containing electrical
components may not be disposed of
together with domestic waste.
It must be separately collected with
electrical and electronic waste according
to local and currently valid legislation.

| Design Guide |
| Software version: 6.4x |

This Design Guide can be used for all FC 300 frequency
converters with software version 6.4 x .
The software version number can be seen from 15-43 Software
Version.

### 2.3.1 CE Conformity and Labelling

The machinery directive (2006/42/EC)
Frequency converters do not fall under the machinery directive. However, if a frequency converter is supplied for use in a machine, we provide information on safety aspects relating to the frequency converter.

## What is CE Conformity and Labelling?

The purpose of CE labelling is to avoid technical trade obstacles within EFTA and the EU. The EU has introduced the CE label as a simple way of showing whether a product complies with the relevant EU directives. The CE label says nothing about the specifications or quality of

Safety and Conformity
the product. Frequency converters are regulated by two EU directives:
The low-voltage directive (2006/95/EC)
Frequency converters must be CE labelled in accordance with the low-voltage directive of January 1, 1997. The directive applies to all electrical equipment and appliances used in the 50-1000V AC and the 75-1500V DC voltage ranges. Danfoss CE-labels in accordance with the directive and issues a declaration of conformity upon request.

## The EMC directive (2004/108/EC)

EMC is short for electromagnetic compatibility. The presence of electromagnetic compatibility means that the mutual interference between different components/ appliances does not affect the way the appliances work. The EMC directive came into effect January 1, 1996. Danfoss CE-labels in accordance with the directive and issues a declaration of conformity upon request. To carry out EMC-correct installation, see the instructions in this Design Guide. In addition, we specify which standards our products comply with. We offer the filters presented in the specifications and provide other types of assistance to ensure the optimum EMC result.

The frequency converter is most often used by professionals of the trade as a complex component forming part of a larger appliance, system or installation. It must be noted that the responsibility for the final EMC properties of the appliance, system or installation rests with the installer.

### 2.3.2 What Is Covered

The EU "Guidelines on the Application of Council Directive 2004/108/EC" outline three typical situations of using a frequency converter. See below for EMC coverage and CE labelling.

1. The frequency converter is sold directly to the end-consumer. The frequency converter is for example sold to a DIY market. The end-consumer is a layman. He installs the frequency converter himself for use with a hobby machine, a kitchen appliance, etc. For such applications, the frequency converter must be CE labelled in accordance with the EMC directive.
2. The frequency converter is sold for installation in a plant. The plant is built up by professionals of the trade. It could be a production plant or a heating/ventilation plant designed and installed by professionals of the trade. Neither the frequency converter nor the finished plant has to be CE labelled under the EMC directive. However, the unit must comply with the basic EMC requirements of the directive. This is ensured by using components, appliances, and systems that are CE labelled under the EMC directive.
3. The frequency converter is sold as part of a complete system. The system is being marketed as complete and could e.g. be an air-conditioning system. The complete system must be CE labelled in accordance with the EMC directive. The manufacturer can ensure CE labelling under the EMC directive either by using CE labelled components or by testing the EMC of the system. If he chooses to use only CE labelled components, he does not have to test the entire system.

### 2.3.3 Danfoss Frequency Converter and CE Labelling

CE labelling is a positive feature when used for its original purpose, i.e. to facilitate trade within the EU and EFTA.

However, CE labelling may cover many different specifications. Thus, you have to check what a given CE label specifically covers.

The covered specifications can be very different and a CE label may therefore give the installer a false feeling of security when using a frequency converter as a component in a system or an appliance.

Danfoss CE labels the frequency converters in accordance with the low-voltage directive. This means that if the frequency converter is installed correctly, we guarantee compliance with the low-voltage directive. Danfoss issues a declaration of conformity that confirms our CE labelling in accordance with the low-voltage directive.

The CE label also applies to the EMC directive provided that the instructions for EMC-correct installation and filtering are followed. On this basis, a declaration of conformity in accordance with the EMC directive is issued.

The Design Guide offers detailed instructions for installation to ensure EMC-correct installation. Furthermore, Danfoss specifies which our different products comply with.

Danfoss provides other types of assistance that can help you obtain the best EMC result.

### 2.3.4 Compliance with EMC Directive 2004/108/EC

As mentioned, the frequency converter is mostly used by professionals of the trade as a complex component forming part of a larger appliance, system, or installation. It must be noted that the responsibility for the final EMC properties of the appliance, system or installation rests
with the installer. As an aid to the installer, Danfoss has prepared EMC installation guidelines for the Power Drive system. The standards and test levels stated for Power Drive systems are complied with, provided that the EMCcorrect instructions for installation are followed, see the section EMC Immunity.

The frequency converter has been designed to meet the IEC/EN 60068-2-3 standard, EN 50178 pkt. 9.4.2.2 at $50^{\circ} \mathrm{C}$.
A frequency converter contains a large number of mechanical and electronic components. All are to some extent vulnerable to environmental effects.

## ACAUTION

The frequency converter should not be installed in environments with airborne liquids, particles, or gases capable of affecting and damaging the electronic components. Failure to take the necessary protective measures increases the risk of stoppages, thus reducing the life of the frequency converter.

## Degree of protection as per IEC 60529

The safe Stop function may only be installed and operated in a control cabinet with degree of protection IP54 or higher (or equivalent environment). This is required to avoid cross faults and short circuits between terminals, connectors, tracks and safety-related circuitry caused by foreign objects.

Liquids can be carried through the air and condense in the frequency converter and may cause corrosion of components and metal parts. Steam, oil, and salt water may cause corrosion of components and metal parts. In such environments, use equipment with enclosure rating IP $54 / 55$. As an extra protection, coated printed circuit boards can be ordered as an option.

Airborne Particles such as dust may cause mechanical, electrical, or thermal failure in the frequency converter. A typical indicator of excessive levels of airborne particles is dust particles around the frequency converter fan. In very dusty environments, use equipment with enclosure rating IP 54/55 or a cabinet for IP 00/IP 20/TYPE 1 equipment.

In environments with high temperatures and humidity, corrosive gases such as sulphur, nitrogen, and chlorine compounds will cause chemical processes on the frequency converter components.

Such chemical reactions will rapidly affect and damage the electronic components. In such environments, mount the equipment in a cabinet with fresh air ventilation, keeping aggressive gases away from the frequency converter. An extra protection in such areas is a coating of the printed circuit boards, which can be ordered as an option.

## NOTE

Mounting frequency converters in aggressive environments increases the risk of stoppages and considerably reduces the life of the converter.

Before installing the frequency converter, check the ambient air for liquids, particles, and gases. This is done by observing existing installations in this environment. Typical indicators of harmful airborne liquids are water or oil on metal parts, or corrosion of metal parts.

Excessive dust particle levels are often found on installation cabinets and existing electrical installations. One indicator of aggressive airborne gases is blackening of copper rails and cable ends on existing installations.

D and E enclosures have a stainless steel back-channel option to provide additional protection in aggressive environments. Proper ventilation is still required for the internal components of the drive. Contact Danfoss for additional information.

The frequency converter has been tested according to the procedure based on the shown standards:

The frequency converter complies with requirements that exist for units mounted on the walls and floors of production premises, as well as in panels bolted to walls or floors.

- IEC/EN 60068-2-6: Vibration (sinusoidal) - 1970
- IEC/EN 60068-2-64: Vibration, broad-band random

D and E frames have a stainless steel backchannel option to provide additional protection in aggressive environments. Proper ventilation is still required for the internal components of the drive. Contact factory for additional information.

## 3 Introduction to FC 300

### 3.1 Product Overview

## NOTE

The F frames are available with or without options cabinet. The F8, F10 and F12 consist of an inverter cabinet on the right and rectifier cabinet on the left. The F9, F11 and F13 have an additional options cabinet left of the rectifier cabinet. The F9 is an F8 with an additional options cabinet. The F11 is an F10 with an additional options cabinet. The F13 is an F12 with an additional options cabinet.

### 3.2.1 Control Principle

A frequency converter rectifies $A C$ voltage from mains into DC voltage, after which this DC voltage is converted into a AC current with a variable amplitude and frequency.

The motor is supplied with variable voltage / current and frequency, which enables infinitely variable speed control of three-phased, standard AC motors and permanent magnet synchronous motors.

### 3.2.2 FC 300 Controls

The frequency converter is capable of controlling either the speed or the torque on the motor shaft. Setting 1-00 Configuration Mode determines the type of control.

## Speed control:

There are two types of speed control:

- Speed open loop control which does not require any feedback from motor (sensorless).
- Speed closed loop PID control requires a speed feedback to an input. A properly optimised speed closed loop control will have higher accuracy than a speed open loop control.

Selects which input to use as speed PID feedback in 7-00 Speed PID Feedback Source.

## Torque control (FC 302 only):

The torque control function is used in applications where the torque on motor output shaft is controlling the application as tension control. Torque control can be selected in par. 1-00, either in VVC+ open loop [4] or Flux control closed loop with motor speed feedback [2]. Torque setting is done by setting an analog, digital or bus controlled reference. The max speed limit factor is set in par. 4-21. When running torque control it is recommended to make a full AMA procedure as the correct motor data are of high importance for optimal performance.

- Closed loop in Flux mode with encoder feedback offers superior performance in all four quadrants and at all motor speeds.
- Open loop in VVC+ mode. The function is used in mechanical robust applications, but the accuracy is limited. Open loop torque function works basically only in one speed direction. The torque is calculated on basic of current measurement internal in the frequency converter. See Application Example Torque open Loop

Speed / torque reference:
The reference to these controls can either be a single refrence or be the sum of various references including relatively scaled references. The handling of references is explained in detail later in this section.

## 3．2．3 FC 301 vs．FC 302 Control Principle

FC 301 is a general purpose frequency converter for variable speed applications．The control principle is based on Voltage Vector Control（VVCplus）．
FC 301 can handle asynchronous motors only．
The current sensing principle in FC 301 is based on current measurement in the DC link or motor phase．The ground fault protection on the motor side is solved by a de－saturation circuit in the IGBTs connected to the control board．
Short circuit behaviour on FC 301 depends on the current transducer in the positive DC link and the desaturation protection with feedback from the 3 lower IGBT＇s and the brake．

Illustration 3．1 FC 301

FC 302 is a high performance frequency converter for demanding applications．The frequency converter can handle various kinds of motor control principles such as U／f special motor mode，VVCplus or Flux Vector motor control．
FC 302 is able to handle Permanent Magnet Synchronous Motors（Brushless servo motors）as well as normal squirrel cage asynchronous motors．
Short circuit behaviour on FC 302 depends on the 3 current transducers in the motor phases and the desaturation protection with feedback from the brake．

Illustration 3．2 FC 302

### 3.2.4 Control Structure in VVC ${ }^{\text {plus }}$ Advanced Vector Control

Control structure in $\mathrm{VV} C^{\text {plus }}$ open loop and closed loop configurations:

In the configuration shown in Illustration 3.3, 1-01 Motor Control Principle is set to "VVC ${ }^{\text {plus }}$ [1]" and 1-00 Configuration Mode is set to "Speed open loop [0]". The resulting reference from the reference handling system is received and fed through the ramp limitation and speed limitation before being sent to the motor control. The output of the motor control is then limited by the maximum frequency limit.

If 1-00 Configuration Mode is set to "Speed closed loop [1]" the resulting reference will be passed from the ramp limitation and speed limitation into a speed PID control. The Speed PID control parameters are located in the parameter group 7-0*. The resulting reference from the Speed PID control is sent to the motor control limited by the frequency limit.

Select "Process [3]" in 1-00 Configuration Mode to use the process PID control for closed loop control of e.g. speed or pressure in the controlled application. The Process PID parameters are located in parameter group 7-2* and 7-3*.

Introduction to FC 300
FC 300 Design Guide

### 3.2.5 Control Structure in Flux Sensorless (FC 302 only)

Control structure in Flux sensorless open loop and closed loop configurations.

In the shown configuration, 1-01 Motor Control Principle is set to "Flux sensorless [2]" and 1-00 Configuration Mode is set to "Speed open loop [0]". The resulting reference from the reference handling system is fed through the ramp and speed limitations as determined by the parameter settings indicated.

An estimated speed feedback is generated to the Speed PID to control the output frequency.
The Speed PID must be set with its P,I, and D parameters (parameter group 7-0*).

Select "Process [3]" in 1-00 Configuration Mode to use the process PID control for closed loop control of i.e. speed or pressure in the controlled application. The Process PID parameters are found in parameter group 7-2* and 7-3*.

### 3.2.6 Control Structure in Flux with Motor Feedback

Control structure in Flux with motor feedback configuration (only available in FC 302):

In the shown configuration, 1-01 Motor Control Principle is set to "Flux w motor feedb [3]" and 1-00 Configuration Mode is set to "Speed closed loop [1]".

The motor control in this configuration relies on a feedback signal from an encoder mounted directly on the motor (set in 1-02 Flux Motor Feedback Source).

Select "Speed closed loop [1]" in 1-00 Configuration Mode to use the resulting reference as an input for the Speed PID control. The Speed PID control parameters are located in parameter group 7-0*.

Select "Torque [2]" in 1-00 Configuration Mode to use the resulting reference directly as a torque reference. Torque control can only be selected in the Flux with motor feedback (1-01 Motor Control Principle) configuration. When this mode has been selected, the reference will use the Nm unit. It requires no torque feedback, since the actual torque is calculated on the basis of the current measurement of the frequency converter.

Select "Process [3]" in 1-00 Configuration Mode to use the process PID control for closed loop control of e.g. speed or a process variable in the controlled application.

### 3.2.7 Internal Current Control in VVC ${ }^{\text {plus }}$ Mode

The frequency converter features an integral current limit control which is activated when the motor current, and thus the torque, is higher than the torque limits set in 4-16 Torque Limit Motor Mode, 4-17 Torque Limit Generator Mode and 4-18 Current Limit.
When the frequency converter is at the current limit during motor operation or regenerative operation, the frequency converter will try to get below the preset torque limits as quickly as possible without losing control of the motor.

### 3.2.8 Local (Hand On) and Remote (Auto On) Control

The frequency converter can be operated manually via the local control panel (LCP) or remotely via analog and digital inputs and serial bus. If allowed in 0-40 [Hand on] Key on LCP, 0-41 [Off] Key on LCP, 0-42 [Auto on] Key on LCP, and $0-43$ [Reset] Key on LCP, it is possible to start and stop the frequency converter via the LCP using the [Hand ON] and [Off] keys. Alarms can be reset via the [RESET] key. After pressing the [Hand ON] key, the frequency converter goes into Hand mode and follows (as default) the Local reference that can be set using arrow key on the LCP.

After pressing the [Auto On] key, the frequency converter goes into Auto mode and follows (as default) the Remote reference. In this mode, it is possible to control the frequency converter via the digital inputs and various serial interfaces (RS-485, USB, or an optional fieldbus). See more about starting, stopping, changing ramps and parameter set-ups etc. in parameter group 5-1* (digital inputs) or parameter group 8-5* (serial communication).

## Active Reference and Configuration Mode

The active reference can be either the local reference or the remote reference.

In 3-13 Reference Site the local reference can be permanently selected by selecting Local [2].
To permanently select the remote reference select Remote [1]. By selecting Linked to Hand/Auto [0] (default) the reference site will depend on which mode is active. (Hand Mode or Auto Mode).

| Hand OnAutoLCP Keys | 3-13 Reference Site | Active Reference |
| :--- | :--- | :--- |
| Hand | Linked to Hand / <br> Auto | Local |
| Hand -> Off | Linked to Hand / <br> Auto | Local |
| Auto | Linked to Hand / <br> Auto | Remote |
| Auto -> Off | Linked to Hand / <br> Auto | Remote |
| All keys | Local | Local |
| All keys | Remote | Remote |

Table 3.1 Conditions for Local/Remote Reference Activation.
1-00 Configuration Mode determines what kind of application control principle (i.e. Speed, Torque or Process Control) is used when the remote reference is active. 1-05 Local Mode Configuration determines the kind of application control principle that is used when the local reference is active. One of them is always active, but both can not be active at the same time.

### 3.3 Reference Handling

## Local Reference

The local reference is active when the frequency converter is operated with 'Hand On' button active. Adjust the reference by up/down and left/right arrows respectively.

## Remote Reference

The reference handling system for calculating the Remote reference is shown in Illustration 3.3.

The Remote Reference is calculated once every scan interval and initially consists of two types of reference inputs:

1. $\quad X$ (the external reference): A sum (see 3-04 Reference Function) of up to four externally selected references, comprising any combination (determined by the setting of 3-15 Reference Resource 1, 3-16 Reference Resource 2 and 3-17 Reference Resource 3) of a fixed preset reference (3-10 Preset Reference), variable analog references, variable digital pulse references, and various serial bus references in whatever unit the frequency converter is controlled ([Hz], [RPM], [ Nm ] etc.).
2. $Y$ - (the relative reference): A sum of one fixed preset reference (3-14 Preset Relative Reference) and one variable analog reference (3-18 Relative Scaling Reference Resource) in [\%].

The two types of reference inputs are combined in the following formula: Remote reference $=X+X * Y / 100 \%$. If relative reference is not used par. 3-18 must be set to No function and par. 3-14 to $0 \%$. The catch up / slow down function and the freeze reference function can both be activated by digital inputs on the frequency converter. The functions and parameters are described in the Programming Guide, MG33MXYY.
The scaling of analog references are described in parameter groups 6-1* and 6-2*, and the scaling of digital pulse references are described in parameter group 5-5*. Reference limits and ranges are set in parameter group 3-0*.

### 3.3.1 Reference Limits

3-00 Reference Range, 3-02 Minimum Reference and 3-03 Maximum Reference together define the allowed range of the sum of all references. The sum of all references are clamped when necessary. The relation between the resulting reference (after clamping) and the sum of all references is shown below.

The value of 3-02 Minimum Reference can not be set to less than 0 , unless $1-00$ Configuration Mode is set to [3] Process. In that case the following relations between the resulting reference (after clamping) and the sum of all references is as shown in Illustration 3.4.

$$
\begin{gathered}
\text { P 3-00 Reference Range }=[0] \text { Min to Max } \\
\text { Resulting reference }
\end{gathered}
$$

[^0]
### 3.3.2 Scaling of Preset References and Bus References

Preset references are scaled according to the following rules:

- When 3-00 Reference Range : [0] Min - Max 0\% reference equals 0 [unit] where unit can be any unit e.g. rpm, m/s, bar etc. $100 \%$ reference equals the Max (abs (3-03 Maximum Reference ), abs (3-02 Minimum Reference)).
- When 3-00 Reference Range : [1] -Max - +Max 0\% reference equals 0 [unit] - $100 \%$ reference equals Max Reference $100 \%$ reference equals Max Reference.

Bus references are scaled according to the following rules:

### 3.3.3 Scaling of Analog and Pulse References and Feedback

References and feedback are scaled from analog and pulse inputs in the same way. The only difference is that a reference above or below the specified minimum and maximum "endpoints" (P1 and P2 in Illustration 3.5) are clamped whereas a feedback above or below is not.

Illustration 3.5 Scaling of Analog and Pulse References and Feedback

Introduction to FC 300
FC 300 Design Guide

The endpoints P1 and P2 are defined by the following parameters depending on which analog or pulse input is used

|  | $\begin{array}{\|l} \text { Analog } 53 \\ \text { S201=OFF } \end{array}$ | $\text { Analog } 53$ $\mathrm{S} 201=\mathrm{ON}$ | Analog 54 $S 202=\mathrm{OFF}$ | Analog 54 $\mathrm{S} 202=\mathrm{ON}$ | Pulse Input 29 | Pulse Input 33 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| P1 = (Minimum input value, Minimum reference value) |  |  |  |  |  |  |
| Minimum reference value | 6-14 Terminal 53 Low Ref./Feedb. Value | 6-14 Terminal 53 Low Ref./Feedb. Value | 6-24 Terminal 54 Low Ref./Feedb. Value | 6-24 Terminal 54 Low Ref./Feedb. Value | 5-52 Term. 29 Low Ref./Feedb. Value | 5-57 Term. 33 Low Ref./ Feedb. Value |
| Minimum input value | 6-10 Terminal 53 Low Voltage [V] | 6-12 Terminal 53 Low Current [mA] | 6-20 Terminal 54 Low Voltage [V] | 6-22 Terminal 54 Low Current $[\mathrm{mA}]$ | 5-50 Term. 29 Low Frequency [Hz] | 5-55 Term. 33 Low Frequency [Hz] |
| P2 = (Maximum input value, Maximum reference value) |  |  |  |  |  |  |
| Maximum reference value | 6-15 Terminal 53 High Ref./Feedb. Value | 6-15 Terminal 53 High Ref./Feedb. Value | 6-25 Terminal 54 High Ref./Feedb. Value | 6-25 Terminal 54 High Ref./Feedb. Value | 5-53 Term. 29 High Ref./Feedb. Value | 5-58 Term. 33 High Ref./ Feedb. Value |
| Maximum input value | 6-11 Terminal 53 High Voltage [V] | 6-13 Terminal 53 High Current [mA] | 6-21 Terminal 54 High Voltage[V] | 6-23 Terminal 54 <br> High Current[mA] | $\begin{aligned} & \text { 5-51 Term. } 29 \\ & \text { High Frequency } \\ & {[\mathrm{Hz}]} \\ & \hline \end{aligned}$ | 5-56 Term. 33 High Frequency [Hz] |

### 3.3.4 Dead Band Around Zero

In some cases the reference (in rare cases also the feedback) should have a Dead Band around zero (i.e. to make sure the machine is stopped when the reference is "near zero").

To make the dead band active and to set the amount of dead band, the following settings must be done:

- Either Minimum Reference Value (see table above for relevant parameter) or Maximum Reference Value must be zero. In other words; Either P1 or P2 must be on the X -axis in the graph below.
- And both points defining the scaling graph are in the same quadrant.

The size of the Dead Band is defined by either P1 or P2 as shown inIllustration 3.6.

Thus a reference endpoint of $\mathrm{P} 1=(0 \mathrm{~V}, 0 \mathrm{RPM})$ will not result in any dead band, but a reference endpoint of e.g. P1 $=(1 \mathrm{~V}, 0 \mathrm{RPM})$ will result in a -1 V to +1 V dead band in this case provided that the end point P2 is placed in either Quadrant 1 or Quadrant 4.

Introduction to FC 300
FC 300 Design Guide

Case 1: Positive Reference with Dead band, Digital input to trigger reverse
This Case shows how Reference input with limits inside Min - Max limits clamps.

Case 2: Positive Reference with Dead band, Digital input to trigger reverse. Clamping rules.
This Case shows how Reference input with limits outside -Max - +Max limits clamps to the inputs low and high limits before addition to External reference. And how the External reference is clamped to -Max - +Max by the Reference algorithm.

Introduction to FC 300

Case 3: Negative to positive reference with dead band, Sign determines the direction, - Max -+ Max

### 3.4 PID Control

### 3.4.1 Speed PID Control

| 1-00 Configuration Mode | $1-01$ Motor Control Principle |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :---: |
|  | U/f | VVCplus | Flux Sensorless |  |  |
| [0] Speed open loop | Not Active | Not Active | ACTIVE | ACTIVE |  |
| [1] Speed closed loop | N.A. | N.A. | N.A. |  |  |
| [2] Torque | N.A. | Not Active | N.A. |  |  |
| [3] Process |  | ACTIVE | Not Active |  |  |

Table 3.2 Control configurations where the Speed Control is active
"N.A." means that the specific mode is not available at all. "Not Active" means that the specific mode is available but the Speed Control is not active in that mode.

## NOTE

The Speed Control PID will work under the default parameter setting, but tuning the parameters is highly recommended to optimize the motor control performance. The two Flux motor control principles are particularly dependant on proper tuning to yield their full potential.

The following parameters are relevant for the Speed Control:

## Example of how to Programme the Speed Control

 In this case the Speed PID Control is used to maintain a constant motor speed regardless of the changing load on the motor. The required motor speed is set via a potentiometer connected to terminal 53 . The speed range is $0-$ 1500 RPM corresponding to $0-10 \mathrm{~V}$ over the potentiometer. Starting and stopping is controlled by a switch connected to terminal 18 . The Speed PID monitors the actual RPM of the motor by using a 24 V (HTL) incremental encoder as feedback. The feedback sensor is an encoder (1024 pulses per revolution) connected to terminals 32 and 33.

The following must be programmed in order shown (see explanation of settings in the Programming Guide)
In the list it is assumed that all other parameters and switches remain at their default setting.

| Function | parameter no. | Setting |
| :---: | :---: | :---: |
| 1) Make sure the motor runs properly. Do the following: |  |  |
| Set the motor parameters using name plate data | 1-2* | As specified by motor name plate |
| Have the frequency converter makes an Automatic Motor Adaptation | 1-29 Automatic Motor Adaptation (AMA) | [1] Enable complete AMA |
| 2) Check the motor is running and the encoder is attached properly. Do the following: |  |  |
| Press the "Hand On" LCP key. Check that the motor is running and note in which direction it is turning (henceforth referred to as the "positive direction"). |  | Set a positive reference. |
| Go to 16-20 Motor Angle. Turn the motor slowly in the positive direction. It must be turned so slowly (only a few RPM) that it can be determined if the value in 16-20 Motor Angle is increasing or decreasing. | 16-20 Motor Angle | N.A. (read-only parameter) Note: An increasing value overflows at 65535 and starts again at 0 . |
| If 16-20 Motor Angle is decreasing then change the encoder direction in 5-71 Term 32/33 Encoder Direction. | $\begin{array}{\|l\|} \hline 5-71 \text { Term 32/33 } \\ \text { Encoder Direction } \end{array}$ | [1] Counter clockwise (if 16-20 Motor Angle is decreasing) |
| 3) Make sure the drive limits are set to safe values |  |  |
| Set acceptable limits for the references. | 3-02 Minimum Reference 3-03 Maximum Reference | 0 RPM (default) 1500 RPM (default) |
| Check that the ramp settings are within drive capabilities and allowed application operating specifications. | 3-41 Ramp 1 Ramp up Time 3-42 Ramp 1 Ramp Down Time | default setting default setting |
| Set acceptable limits for the motor speed and frequency. | 4-11 Motor Speed Low Limit [RPM] 4-13 Motor Speed High Limit [RPM] 4-19 Max Output Frequency | 0 RPM (default) 1500 RPM (default) 60 Hz (default 132 Hz ) |
| 4) Configure the Speed Control and select the Motor Control principle |  |  |
| Activation of Speed Control | 1-00 Configuration Mode | [1] Speed closed loop |
| Selection of Motor Control Principle | 1-01 Motor Control Principle | [3] Flux w motor feedb |
| 5) Configure and scale the reference to the Speed Control |  |  |
| Set up Analog Input 53 as a reference Source | 3-15 Reference Resource 1 | Not necessary (default) |
| Scale Analog Input 530 RPM (0V) to 1500 RPM (10V) | 6-1* | Not necessary (default) |
| 6) Configure the 24V HTL encoder signal as feedback for the Motor Control and the Speed Control |  |  |
| Set up digital input 32 and 33 as encoder inputs | 5-14 Terminal 32 Digital Input 5-15 Terminal 33 Digital Input | [0] No operation (default) |
| Choose terminal 32/33 as motor feedback | 1-02 Flux Motor Feedback Source | Not necessary (default) |
| Choose terminal 32/33 as Speed PID feedback | 7-00 Speed PID Feedback Source | Not necessary (default) |
| 7) Tune the Speed Control PID parameters |  |  |
| Use the tuning guidelines when relevant or tune manually | 7-0* | See the guidelines below |
| 8) Finished! |  |  |
| Save the parameter setting to the LCP for safe keeping | 0-50 LCP Copy | [1] All to LCP |

### 3.4.2 Tuning PID Speed Control

The following tuning guidelines are relevant when using one of the Flux motor control principles in applications where the load is mainly inertial (with a low amount of friction).

The value of $30-83$ Speed PID Proportional Gain is dependent on the combined inertia of the motor and load, and the selected bandwidth can be calculated using the following formula:

Par. $7-02=\frac{\text { Total inertia }\left[\mathrm{kgm}^{2}\right] \times \text { par. } 1-25}{\text { Par. } 1-20 \times 9550} \times$ Bandwidth $[\mathrm{rad} / \mathrm{s}]$

## NOTE

$1-20$ Motor Power $[\mathrm{kW}]$ is the motor power in [kW] (i.e. enter '4' kW instead of ' 4000 ' W in the formula).

A practical value for the Bandwith is $20 \mathrm{rad} / \mathrm{s}$. Check the result of the 30-83 Speed PID Proportional Gain calculation against the following formula (not required if you are using a high resolution feedback such as a SinCos feedback):

Par. $7-02$ MAX $=\frac{0.01 \times 4 \times \text { Encoder Resolution } \times \text { Par. } 7-06}{2 \times \pi} \times$ Max torque ripple [\%]
A good start value for 7-06 Speed PID Lowpass Filter Time is 5 ms (lower encoder resolution calls for a higher filter value). Typically a Max Torque Ripple of $3 \%$ is acceptable.

For incremental encoders the Encoder Resolution is found in either 5-70 Term 32/33 Pulses per Revolution (24V HTL on standard drive) or 17-11 Resolution (PPR) (5V TLL on MCB102 Option).

Generally the practical maximum limit of 30-83 Speed PID Proportional Gain is determined by the encoder resolution and the feedback filter time but other factors in the application might limit the 30-83 Speed PID Proportional Gain to a lower value.

To minimize the overshoot, 7-03 Speed PID Integral Time could be set to approx. 2.5 sec . (varies with the application).

7-04 Speed PID Differentiation Time should be set to 0 until everything else is tuned. If necessary finish the tuning by experimenting with small increments of this setting.

The table shows the control configurations where the Process Control is possible. When a Flux Vector motor control principle is used, take care also to tune the Speed Control PID parameters. Refer to the section about the Control Structure to see where the Speed Control is active.

| $1-00$ <br> ration Mode | 1 1-01 Motor Control Principle |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | U/f | VVClus | Flux <br> Sensorless | Flux w/ enc. <br> feedb |
| [3] Process | N.A. | Process |  <br> Speed |  <br> Speed |

## NOTE

The Process Control PID will work under the default parameter setting, but tuning the parameters is highly recommended to optimise the application control performance. The two Flux motor control principles are specially dependant on proper Speed Control PID tuning (prior to tuning the Process Control PID) to yield their full potential.

### 3.4.3 Process PID Control

The Process PID Control can be used to control application parameters that can be measured by a sensor (i.e. pressure, temperature, flow) and be affected by the connected motor through a pump, fan or otherwise.

[^1]The following parameters are relevant for the Process Control

| Parameter | Description of function |
| :---: | :---: |
| 7-20 Process CL Feedback 1 Resource | Select from which Source (i.e. analog or pulse input) the Process PID should get its feedback |
| 7-22 Process CL Feedback 2 Resource | Optional: Determine if (and from where) the Process PID should get an additional feedback signal. If an additional feedback source is selected the two feedback signals will be added together before being used in the Process PID Control. |
| 7-30 Process PID Normal/ Inverse Control | Under [0] Normal operation the Process Control will respond with an increase of the motor speed if the feedback is getting lower than the reference. In the same situation, but under [1] Inverse operation, the Process Control will respond with a decreasing motor speed instead. |
| 7-31 Process PID Anti Windup | The anti windup function ensures that when either a frequency limit or a torque limit is reached, the integrator will be set to a gain that corresponds to the actual frequency. This avoids integrating on an error that cannot in any case be compensated for by means of a speed change. This function can be disabled by selecting [0] "Off". |
| 7-32 Process PID Start Speed | In some applications, reaching the required speed/set point can take a very long time. In such applications it might be an advantage to set a fixed motor speed from the frequency converter before the process control is activated. This is done by setting a Process PID Start Value (speed) in 7-32 Process PID Start Speed. |
| 7-33 Process PID Proportional Gain | The higher the value - the quicker the control. However, too large value may lead to oscillations. |
| 7-34 Process PID Integral Time | Eliminates steady state speed error. Lower value means quick reaction. However, too small value may lead to oscillations. |
| 7-35 Process PID Differentiation Time | Provides a gain proportional to the rate of change of the feedback. A setting of zero disables the differentiator. |
| 7-36 Process PID Diff. Gain Limit | If there are quick changes in reference or feedback in a given application - which means that the error changes swiftly - the differentiator may soon become too dominant. This is because it reacts to changes in the error. The quicker the error changes, the stronger the differentiator gain is. The differentiator gain can thus be limited to allow setting of the reasonable differentiation time for slow changes. |
| 7-38 Process PID Feed Forward Factor | In application where there is a good (and approximately linear) correlation between the process reference and the motor speed necessary for obtaining that reference, the Feed Forward Factor can be used to achieve better dynamic performance of the Process PID Control. |
| 5-54 Pulse Filter Time Constant \#29 (Pulse term. 29), 5-59 Pulse Filter Time Constant \#33 (Pulse term. 33), 6-16 Terminal 53 Filter Time Constant (Analog term 53), 6-26 Terminal 54 Filter Time Constant (Analog term. 54) | If there are oscillations of the current/voltage feedback signal, these can be dampened by means of a low-pass filter. This time constant represents the speed limit of the ripples occurring on the feedback signal. <br> Example: If the low-pass filter has been set to 0.1 s , the limit speed will be $10 \mathrm{RAD} / \mathrm{sec}$. (the reciprocal of 0.1 s$)$, corresponding to $(10 /(2 \times \pi))=1.6 \mathrm{~Hz}$. This means that all currents/voltages that vary by more than 1.6 oscillations per second will be damped by the filter. The control will only be carried out on a feedback signal that varies by a frequency (speed) of less than 1.6 Hz . <br> The low-pass filter improves steady state performance but selecting a too large filter time will deteriorate the dynamic performance of the Process PID Control. |

### 3.4.4 Example of Process PID Control

The following is an example of a Process PID Control used in a ventilation system:

In a ventilation system, the temperature is to be settable from $-5-35^{\circ} \mathrm{C}$ with a potentiometer of $0-10 \mathrm{~V}$. The set temperature must be kept constant, for which purpose the Process Control is to be used.

The control is of the inverse type, which means that when the temperature increases, the ventilation speed is increased as well, so as to generate more air. When the temperature drops, the speed is reduced. The transmitter used is a temperature sensor with a working range of $-10-40^{\circ} \mathrm{C}, 4-20 \mathrm{~mA}$. Min. / Max. speed $300 / 1500$ RPM.

1. Start/Stop via switch connected to terminal 18.
2. Temperature reference via potentiometer $\left(-5-35^{\circ} \mathrm{C}, 0-10 \mathrm{VDC}\right)$ connected to terminal 53.
3. Temperature feedback via transmitter $\left(-10-40^{\circ} \mathrm{C}\right.$, $4-20 \mathrm{~mA}$ ) connected to terminal 54 . Switch S202 set to ON (current input).

Introduction to FC 300

| Function | Par. no. | Setting |
| :---: | :---: | :---: |
| Initialize the frequency converter | 14-22 | [2] Initialization - make a power cycling - press reset |
| 1) Set motor parameters: |  |  |
| Set the motor parameters according to name plate data | 1-2* | As stated on motor name plate |
| Perform a full Automation Motor Adaptation | 1-29 | [1] Enable complete AMA |
| 2) Check that motor is running in the right direction. <br> When motor is connected to frequency converter with straight forward phase order as $\mathrm{U}-\mathrm{U} ; \mathrm{V}-\mathrm{V} ; \mathrm{W}-\mathrm{W}$ motor shaft usually turns clockwise seen into shaft end. |  |  |
| Press "Hand On" LCP key. Check shaft direction by applying a manual reference. |  |  |
| If motor turns opposite of required direction: <br> 1. Change motor direction in $4-10$ Motor Speed Direction <br> 2. Turn off mains - wait for DC link to discharge - switch two of the motor phases | 4-10 | Select correct motor shaft direction |
| Set configuration mode | 1-00 | [3] Process |
| Set Local Mode Configuration | 1-05 | [0] Speed Open Loop |
| 3) Set reference configuration, ie. the range for reference handling. Set scaling of analog input in par. 6-xx |  |  |
| Set reference/feedback units <br> Set min. reference ( $10^{\circ} \mathrm{C}$ ) <br> Set max. reference $\left(80^{\circ} \mathrm{C}\right)$ <br> If set value is determined from a preset value (array parameter), set other reference sources to No Function | $\begin{array}{\|l\|} \hline 3-01 \\ 3-02 \\ 3-03 \\ 3-10 \end{array}$ | [60] ${ }^{\circ} \mathrm{C}$ Unit shown on display <br> $-5^{\circ} \mathrm{C}$ <br> $35^{\circ} \mathrm{C}$ <br> [0] 35\% $\operatorname{Ref}=\frac{\text { Par. } 3-1^{10}(0)}{100} \times((\text { Par. } 3-03)-(\text { par. } 3-02))=24,5^{\circ} \mathrm{C}$ <br> 3-14 Preset Relative Reference to 3-18 Relative Scaling Reference Resource [0] = No Function |
| 4) Adjust limits for the frequency converter: |  |  |
| Set ramp times to an appropriate value as 20 sec . | $\begin{array}{\|l\|} \hline 3-41 \\ 3-42 \\ \hline \end{array}$ | $\begin{array}{\|l\|} \hline 20 \mathrm{sec} . \\ 20 \mathrm{sec} . \\ \hline \end{array}$ |
| Set min. speed limits Set motor speed max. limit Set max. output frequency | $\begin{aligned} & 4-11 \\ & 4-13 \\ & 4-19 \end{aligned}$ | $\begin{aligned} & \hline 300 \mathrm{RPM} \\ & 1500 \mathrm{RPM} \\ & 60 \mathrm{~Hz} \end{aligned}$ |
| Set S201 or S202 to wanted analog input function (Voltage (V) or milli-Amps (I)) NOTE! Switches are sensitive - Make a power cycling keeping default setting of $V$ |  |  |
| 5) Scale analog inputs used for reference and feedback |  |  |
| Set terminal 53 low voltage Set terminal 53 high voltage Set terminal 54 low feedback value Set terminal 54 high feedback value Set feedback source | $\begin{array}{\|l\|} \hline 6-10 \\ 6-11 \\ 6-24 \\ 6-25 \\ 7-20 \\ \hline \end{array}$ | $\begin{array}{\|l\|} \hline 0 \mathrm{~V} \\ 10 \mathrm{~V} \\ -5^{\circ} \mathrm{C} \\ 35^{\circ} \mathrm{C} \\ \text { [2] Analog input } 54 \\ \hline \end{array}$ |
| 6) Basic PID settings |  |  |
| Process PID Normal/Inverse | 7-30 | [0] Normal |
| Process PID Anti Wind-up | 7-31 | [1] On |
| Process PID start speed | 7-32 | 300 rpm |
| Save parameters to LCP | 0-50 | [1] All to LCP |

## Table 3.3 Example of Process PID Control set-up

## Optimisation of the process regulator

The basic settings have now been made; all that needs to be done is to optimise the proportional gain, the integration time and the differentiation time (7-33 Process PID Proportional Gain, 7-34 Process PID Integral Time, 7-35 Process PID Differentiation Time). In most processes, this can be done by following the guidelines given below.

1. Start the motor
2. Set $7-33$ Process PID Proportional Gain to 0.3 and increase it until the feedback signal again begins to vary continuously. Then reduce the value until the feedback signal has stabilised. Now lower the proportional gain by 40-60\%.
3. Set $7-34$ Process PID Integral Time to 20 sec . and reduce the value until the feedback signal again begins to vary continuously. Increase the
integration time until the feedback signal stabilises, followed by an increase of 15-50\%.
4. Only use 7-35 Process PID Differentiation Time for very fast-acting systems only (differentiation time). The typical value is four times the set integration time. The differentiator should only be used when the setting of the proportional gain and the integration time has been fully optimised. Make sure that oscillations on the feedback signal is sufficiently dampened by the lowpass filter on the feedback signal

If necessary, start/stop can be activated a number of times in order to provoke a variation of the feedback signal.

### 3.4.5 Ziegler Nichols Tuning Method

In order to tune the PID controls of the frequency converter, several tuning methods can be used. One approach is to use a technique which was developed in
the 1950s but which has stood the test of time and is still used today. This method is known as the Ziegler Nichols tuning method.

The method described must not be used on applications that could be damaged by the oscillations created by marginally stable control settings.

The criteria for adjusting the parameters are based on evaluating the system at the limit of stability rather than on taking a step response. We increase the proportional gain until we observe continuous oscillations (as measured on the feedback), that is, until the system becomes marginally stable. The corresponding gain $\left(K_{u}\right)$ is called the ultimate gain. The period of the oscillation $\left(P_{u}\right)$ (called the ultimate period) is determined as shown in the figure.

Illustration 3.8 Marginally Stable System
$P_{u}$ should be measured when the amplitude of oscillation is quite small. Then we "back off" from this gain again, as shown in Table 1.
$K_{u}$ is the gain at which the oscillation is obtained.

| Type of Control | Proportional <br> Gain | Integral Time | Differentiation <br> Time |
| :--- | :--- | :--- | :--- |
| PI-control | $0.45^{*} K_{u}$ | $0.833^{*} P_{u}$ | - |
| PID tight control | $0.6^{*} K_{u}$ | $0.5^{*} P_{u}$ | $0.125^{*} P_{u}$ |
| PID some <br> overshoot | $0.33^{*} K_{u}$ | $0.5^{*} P_{u}$ | $0.33^{*} P_{u}$ |

Table 3.4 Ziegler Nichols tuning for regulator, based on a stability boundary.
Experience has shown that the control setting according to Ziegler Nichols rule provides a good closed loop response for many systems. The process operator can do the final tuning of the control iteratively to yield satisfactory
control.

## Step-by-step Description:

### 3.5 General Aspects of EMC

### 3.5.1 General Aspects of EMC Emissions

Electrical interference is usually conducted at frequencies in the range 150 kHz to 30 MHz . Airborne interference from the frequency converter system in the range 30 MHz to 1 GHz is generated from the inverter, motor cable, and the motor. As shown in the illustration below, capacitive currents in the motor cable coupled with a high dU/dt from the motor voltage generate leakage currents.
The use of a screened motor cable increases the leakage current (see illustration below) because screened cables have higher capacitance to earth than unscreened cables. If the leakage current is not filtered, it will cause greater interference on the mains in the radio frequency range below approximately 5 MHz . Since the leakage current $\left(l_{1}\right)$ is carried back to the unit through the screen ( $I_{3}$ ), there will in principle only be a small electro-magnetic field ( $I_{4}$ ) from the screened motor cable according to the below figure.

The screen reduces the radiated interference but increases the low-frequency interference on the mains. The motor cable screen must be connected to the frequency converter enclosure as well as on the motor enclosure. This is best done by using integrated screen clamps so as to avoid twisted screen ends (pigtails). These increase the screen impedance at higher frequencies, which reduces the screen effect and increases the leakage current (I4).
If a screened cable is used for fieldbus, relay, control cable, signal interface and brake, the screen must be mounted on the enclosure at both ends. In some situations, however, it will be necessary to break the screen to avoid current loops.

If the screen is to be placed on a mounting plate for the frequency converter, the mounting plate must be made of metal, because the screen currents have to be conveyed back to the unit. Moreover, ensure good electrical contact from the mounting plate through the mounting screws to the frequency converter chassis.

When unscreened cables are used, some emission requirements are not complied with, although the immunity requirements are observed.

In order to reduce the interference level from the entire system (unit + installation), make motor and brake cables as short as possible. Avoid placing cables with a sensitive signal level alongside motor and brake cables. Radio interference higher than 50 MHz (airborne) is especially generated by the control electronics. Please see for more information on EMC.

### 3.5.2 EMC Test Results

### 3.5.3 Emission Requirements

According to the EMC product standard for adjustable speed frequency converters EN/IEC 61800-3:2004 the EMC requirements depend on the intended use of the frequency converter. Four categories are defined in the EMC product standard. The definitions of the 4 categories together with the requirements for mains supply voltage conducted emissions are given in Table 3.6.

| Category | Definition | Conducted emission requirement <br> according to the limits given in EN <br> 55011 |
| :--- | :--- | :---: |
| C1 | Frequency converters installed in the first environment (home and office) with a <br> supply voltage less than 1000V. | Class B |
| C2 | Frequency converters installed in the first environment (home and office) with a <br> supply voltage less than 1000V, which are neither plug-in nor movable and are <br> intended to be installed and commissioned by a professional. | Class A Group 1 |
| C3 | Frequency converters installed in the second environment (industrial) with a supply <br> voltage lower than 1000 V. | Class A Group 2 |
| C4 | Frequency converters installed in the second environment with a supply voltage <br> equal to or above 1000 V or rated current equal to or above 400A or intended for <br> use in complex systems. | An EMC plan should be made. |

Table 3.6 Emission Requirements

When the generic emission standards are used the frequency converters are required to comply with the following limits

| Environment | Generic standard | Conducted emission requirement <br> according to the limits given in EN 55011 |
| :--- | :--- | :---: |
| First environment <br> (home and office) | EN/IEC 61000-6-3 Emission standard for residential, commercial <br> and light industrial environments. | Class B |
| Second environment <br> (industrial environment) | EN/IEC 61000-6-4 Emission standard for industrial environments. | Class A Group 1 |

### 3.5.4 Immunity Requirements

The immunity requirements for frequency converters depend on the environment where they are installed. The requirements for the industrial environment are higher than the requirements for the home and office environment. All Danfoss frequency converters comply with the requirements for the industrial environment and consequently comply also with the lower requirements for home and office environment with a large safety margin.

In order to document immunity against electrical interference from electrical phenomena, the following immunity tests have been made on a system consisting of a frequency converter (with options if relevant), a screened control cable and a control box with potentiometer, motor cable and motor.
The tests were performed in accordance with the following basic standards:

- EN 61000-4-2 (IEC 61000-4-2): Electrostatic discharges (ESD): Simulation of electrostatic discharges from human beings.
- EN 61000-4-3 (IEC 61000-4-3): Incoming electromagnetic field radiation, amplitude modulated simulation of the effects of radar and radio communication equipment as well as mobile communications equipment.
- EN 61000-4-4 (IEC 61000-4-4): Burst transients: Simulation of interference brought about by switching a contactor, relay or similar devices.
- EN 61000-4-5 (IEC 61000-4-5): Surge transients: Simulation of transients brought about e.g. by lightning that strikes near installations.
- EN 61000-4-6 (IEC 61000-4-6): RF Common mode: Simulation of the effect from radio-transmission equipment joined by connection cables.

See Table 3.7.

| Voltage range: 200-240V, 380-480V |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Basic standard | $\begin{gathered} \text { Burst } \\ \text { IEC 61000-4-4 } \end{gathered}$ | $\begin{gathered} \text { Surge } \\ \text { IEC 61000-4-5 } \end{gathered}$ | $\begin{gathered} \hline \text { ESD } \\ \text { IEC } \\ 61000-4-2 \end{gathered}$ | Radiated electromagnetic field IEC 61000-4-3 | RF common mode voltage IEC 61000-4-6 |

### 3.6.1 PELV - Protective Extra Low Voltage

PELV offers protection by way of extra low voltage. Protection against electric shock is ensured when the electrical supply is of the PELV type and the installation is made as described in local/national regulations on PELV supplies.

All control terminals and relay terminals 01-03/04-06 comply with PELV (Protective Extra Low Voltage) (Does not apply to grounded Delta leg above 400V).

Galvanic (ensured) isolation is obtained by fulfilling requirements for higher isolation and by providing the relevant creapage/clearance distances. These requirements are described in the EN 61800-5-1 standard.

The components that make up the electrical isolation, as described below, also comply with the requirements for higher isolation and the relevant test as described in EN 61800-5-1.
The PELV galvanic isolation can be shown in six locations (see Illustration 3.9):

In order to maintain PELV all connections made to the control terminals must be PELV, e.g. thermistor must be reinforced/double insulated.

1. Power supply (SMPS) incl. signal isolation of $U_{D C}$, indicating the intermediate current voltage.
2. Gate drive that runs the IGBTs (trigger transformers/opto-couplers).
3. Current transducers.
4. Opto-coupler, brake module.
5. Internal inrush, RFI, and temperature measurement circuits.
6. Custom relays.

Illustration 3.9 Galvanic Isolation

The functional galvanic isolation ( $a$ and $b$ on drawing) is for the 24 V back-up option and for the RS485 standard bus interface.

## AWARNING

Installation at high altitude:
380-500V, enclosure A, B and C: At altitudes above 2 km , please contact Danfoss regarding PELV.
$380-500 \mathrm{~V}$, enclosure D, E and F: At altitudes above 3 km , please contact Danfoss regarding PELV.
525-690V: At altitudes above 2km, please contact Danfoss regarding PELV.

## AWARNING

Touching the electrical parts could be fatal - even after the equipment has been disconnected from mains.
Also make sure that other voltage inputs have been disconnected, such as load sharing (linkage of DC intermediate circuit), as well as the motor connection for kinetic back-up.
Before touching any electrical parts, wait at least the amount of time indicated in the Safety Precautions section. Shorter time is allowed only if indicated on the nameplate for the specific unit.

### 3.7.1 Earth Leakage Current

Follow national and local codes regarding protective earthing of equipment with a leakage current $>3,5 \mathrm{~mA}$. Frequency converter technology implies high frequency switching at high power. This will generate a leakage current in the earth connection. A fault current in the frequency converter at the output power terminals might contain a DC component which can charge the filter capacitors and cause a transient earth current. The earth leakage current is made up of several contributions and depends on various system configurations including RFI filtering, screened motor cables, and frequency converter power.

Illustration 3.10 How the leakage current is influenced by the cable length and power size. $\mathrm{Pa}>\mathrm{Pb}$.

The leakage current also depends on the line distortion

Illustration 3.11 How the leakage current is influenced by line distortion.

## NOTE

When a filter is used, turn off 14-50 RFI Filter when charging the filter, to avoid that a high leakage current makes the RCD switch.

EN/IEC61800-5-1 (Power Drive System Product Standard) requires special care if the leakage current exceeds 3.5 mA . Earth grounding must be reinforced in one of the following ways:

- Earth ground wire (terminal 95) of at least $10 \mathrm{~mm}^{2}$
- Two separate earth ground wires both complying with the dimensioning rules

See EN/IEC61800-5-1 and EN50178 for further information.

## Using RCDs

Where residual current devices (RCDs), also known as earth leakage circuit breakers (ELCBs), are used, comply with the following:

Use RCDs of type B only which are capable of detecting AC and DC currents

Use RCDs with an inrush delay to prevent faults due to transient earth currents

Dimension RCDs according to the system configuration and environmental considerations

Illustration 3.12 Main Contributions to Leakage Current.

Illustration 3.13 The influence of the cut-off frequency of the RCD on what is responded to/measured.

See also RCD Application Note, MN.90.GX.02.

### 3.8 Brake Functions in FC 300

Braking function is applied for braking the load on the motor shaft, either as dynamic braking or static braking.

### 3.8.1 Mechanical Holding Brake

A mechanical holding brake mounted directly on the motor shaft normally performs static braking. In some applications the static holding torque is working as static holding of the motor shaft (usually synchronous permanent motors). A holding brake is either controlled by a PLC or directly by a digital output from the frequency converter (relay or solid state).

When the holding brake is included in a safety chain: A frequency converter cannot provide a safe control of a mechanical brake. A redundancy circuitry for the brake control must be included in the total installation.

### 3.8.2 Dynamic Braking

Dynamic Brake established by:

- Resistor brake: A brake IGBT keep the overvoltage under a certain threshold by directing the brake energy from the motor to the connected brake resistor (par. 2-10 = [1]).
- $A C$ brake: The brake energy is distributed in the motor by changing the loss conditions in the motor. The AC brake function cannot be used in applications with high cycling frequency since this will overheat the motor (par. 2-10 = [2]).
- DC brake: An over-modulated DC current added to the AC current works as an eddy current brake (par. 2-02 $\neq 0 \mathrm{sec}$.).

### 3.8.3 Selection of Brake Resistor

To handle higher demands by generatoric braking a brake resistor is necessary. Using a brake resistor ensures that the energy is absorbed in the brake resistor and not in the frequency converter. For more information see the Brake Resistor Design Guide, MG.90.OX.YY.

If the amount of kinetic energy transferred to the resistor in each braking period is not known, the average power can be calculated on the basis of the cycle time and
braking time also called intermittent duty cycle. The resistor intermittent duty cycle is an indication of the duty cycle at which the resistor is active. The below figure shows a typical braking cycle.

Motor suppliers often use S5 when stating the permissible load which is an expression of intermittent duty cycle.

The intermittent duty cycle for the resistor is calculated as follows:

Duty cycle $=t_{b} / T$
$\mathrm{T}=$ cycle time in seconds
$t_{b}$ is the braking time in seconds (of the cycle time)

|  | Cycle time (s) | Braking duty cycle at 100\% torque | Braking duty cycle at over torque (150/160\%) |
| :---: | :---: | :---: | :---: |
| 200-240 V |  |  |  |
| PK25-P11K | 120 | Continuous | 40\% |
| P15K-P37K | 300 | 10\% | 10\% |
| 380-500 V |  |  |  |
| PK37-P75K | 120 | Continuous | 40\% |
| P90K-P160 | 600 | Continuous | 10\% |
| P200-P800 | 600 | 40\% | 10\% |
| 525-600 V |  |  |  |
| PK75-P75K | 120 | Continuous | 40\% |
| 525-690 V |  |  |  |
| P37K-P400 | 600 | 40\% | 10\% |
| P500-P560 | 600 | 40\% ${ }^{1)}$ | 10\% ${ }^{2)}$ |
| P630-P1M0 | 600 | 40\% | 10\% |

## Table 3.8 Braking at High overload torque level

[^2]Introduction to FC 300

Danfoss offers brake resistors with duty cycle of $5 \%, 10 \%$ and $40 \%$. If a $10 \%$ duty cycle is applied, the brake resistors are able to absorb brake power for $10 \%$ of the cycle time. The remaining $90 \%$ of the cycle time will be used on dissipating excess heat.

Make sure the resistor is designed to handle the required braking time.

The max. permissible load on the brake resistor is stated as a peak power at a given intermittent duty cycle and can be calculated as:

The brake resistance is calculated as shown:

| $R_{b r}[\Omega]=\frac{U_{d c}^{2}}{P_{\text {peak }}}$ |
| :--- |
| where |
| $P_{\text {peak }}=P_{\text {motor }} \times \mathrm{M}_{\mathrm{br}}[\%] \times \eta_{\text {motor }} \times \eta_{\mathrm{VLT}}[\mathrm{W}]$ |

As can be seen, the brake resistance depends on the intermediate circuit voltage ( $U_{d c}$ ).
The FC 301 and FC 302 brake function is settled in 4 areas of mains.

| Size | Brake active | Warning <br> before cut <br> out | Cut out (trip) |
| :--- | :--- | :--- | :--- |
| FC301/302 $3 \times$ <br> $200-240 \mathrm{~V}$ | 390 V (UDC) | 405 V | 410 V |
| FC301 $3 \times 380-480$ <br> V | 778 V | 810 V | 820 V |
| FC302 $3 \times 380-500$ <br> V* | $810 \mathrm{~V} / 795 \mathrm{~V}$ | $840 \mathrm{~V} / 828 \mathrm{~V}$ | $850 \mathrm{~V} / 855 \mathrm{~V}$ |
| FC302 $3 \times 525-600$ <br> V | 943 V | 965 V | 975 V |
| FC302 $3 \times 525-690$ <br> V | 1084 V | 1109 V | 1130 V |
| * Power size <br> dependent |  |  |  |

Check that the brake resistor can cope with a voltage of $410 \mathrm{~V}, 820 \mathrm{~V}, 850 \mathrm{~V}, 975 \mathrm{~V}$ or 1130 V - unless Danfoss brake resistors are used.

Danfoss recommends the brake resistance Rrec, i.e. one that guarantees that the frequency converter is able to brake at the highest braking torque ( $\mathrm{Mbr}_{\mathrm{br}}(\%)$ of $160 \%$. The formula can be written as:
$R_{\text {rec }}[\Omega]=\frac{u_{d c}^{2} \times 100}{P_{\text {motor }} \times M_{b r(\%)}{ }^{\times n} V L T^{\times n} \text { motor }}$
$\eta_{\text {motor }}$ is typically at 0.90
$\eta_{\text {VLT }}$ is typically at 0.98

For $200 \mathrm{~V}, 480 \mathrm{~V}, 500 \mathrm{~V}$ and 600 V frequency converters, R rec at $160 \%$ braking torque is written as:
$200 \mathrm{~V}: R_{\text {rec }}=\frac{107780}{P_{\text {motor }}}[\Omega]$
$\left.480 \mathrm{~V}: R_{\text {rec }}=\frac{375300}{P_{\text {motor }}}[\Omega] 1\right)$
$\left.480 \mathrm{~V}: R_{\text {rec }}=\frac{428914}{P_{\text {motor }}}[\Omega] 2\right)$
$500 \mathrm{~V}: R_{\text {rec }}=\frac{464923}{P_{\text {motor }}}[\Omega]$
$600 \mathrm{~V}: R_{\text {rec }}=\frac{630137}{P_{\text {motor }}}[\Omega]$
$690 \mathrm{~V}: R_{\text {rec }}=\frac{832664}{P_{\text {motor }}}[\Omega]$

1) For frequency converters $\leq 7.5 \mathrm{~kW}$ shaft output
2) For frequency converters $11-75 \mathrm{~kW}$ shaft output

## NOTE

The resistor brake circuit resistance selected should not be higher than that recommended by Danfoss. If a brake resistor with a higher ohmic value is selected, the $160 \%$ braking torque may not be achieved because there is a risk that the frequency converter cuts out for safety reasons.

## NOTE

If a short circuit in the brake transistor occurs, power dissipation in the brake resistor is only prevented by using a mains switch or contactor to disconnect the mains for the frequency converter. (The contactor can be controlled by the frequency converter).

## NOTE

Do not touch the brake resistor as it can get very hot while/after braking. The brake resistor must be placed in a secure environment to avoid fire risk

D-F size frequency converters contain more than one brake chopper. Consequently, use one brake resistor per brake chopper for those frame sizes.

### 3.8.4 Control with Brake Function

The brake is protected against short-circuiting of the brake resistor, and the brake transistor is monitored to ensure that short-circuiting of the transistor is detected. A relay/ digital output can be used for protecting the brake resistor against overloading in connection with a fault in the frequency converter.
In addition, the brake makes it possible to read out the momentary power and the mean power for the latest 120 seconds. The brake can also monitor the power energizing and make sure it does not exceed a limit selected in 2-12 Brake Power Limit (kW). In 2-13 Brake Power Monitoring, select the function to carry out when the power transmitted to the brake resistor exceeds the limit set in 2-12 Brake Power Limit (kW).

## NOTE

Monitoring the brake power is not a safety function; a thermal switch is required for that purpose. The brake resistor circuit is not earth leakage protected.

Over voltage control (OVC) (exclusive brake resistor) can be selected as an alternative brake function in 2-17 Overvoltage Control. This function is active for all units. The function ensures that a trip can be avoided if the DC link voltage increases. This is done by increasing the output frequency to limit the voltage from the DC link. It is a very useful function, e.g. if the ramp-down time is too short since tripping of the frequency converter is avoided. In this situation the ramp-down time is extended.

### 3.9.1 Mechanical Brake Control

For hoisting applications, it is necessary to be able to control an electro-magnetic brake. For controlling the brake, a relay output (relay1 or relay2) or a programmed
digital output (terminal 27 or 29) is required. Normally, this output must be closed for as long as the frequency converter is unable to 'hold' the motor, e.g. because of too big load. In 5-40 Function Relay (Array parameter), 5-30 Terminal 27 Digital Output, or 5-31 Terminal 29 Digital Output, select mechanical brake control [32] for applications with an electro-magnetic brake.

When mechanical brake control [32] is selected, the mechanical brake relay stays closed during start until the output current is above the level selected in 2-20 Release Brake Current. During stop, the mechanical brake will close when the speed is below the level selected in 2-21 Activate Brake Speed [RPM]. If the frequency converter is brought into an alarm condition, i.e. over-voltage situation, the mechanical brake immediately cuts in. This is also the case during safe stop.

In hoisting/lowering applications, it must be possible to control an electro-mehanical brake.

## Step-by-step Description

- To control the mechanical brake any relay output or digital output (terminal 27 or 29) can be used. If necessary use a suitable contactor.
- Ensure that the output is switched off as long as the frequency converter is unable to drive the motor, for example due to the load being too
heavy or due to the fact that the motor has not been mounted yet.
- $\quad$ Select Mechanical brake control [32] in parameter group5-4* (or in group 5-3*) before connecting the mechanical brake.
- The brake is released when the motor current exceeds the preset value in 2-20 Release Brake Current.
- The brake is engaged when the output frequency is less than the frequency set in 2-21 Activate Brake Speed [RPM] or 2-22 Activate Brake Speed
[ Hz$]$ and only if the frequency converter carries out a stop command.

## NOTE

For vertical lifting or hoisting applications it is strongly recommended to ensure that the load can be stopped in case of an emergency or a malfunction of a single $t$ such as a contactor, etc.
If the frequency converter is in alarm mode or in an over voltage situation, the mechanical brake cuts in.

## NOTE

For hoisting applications make sure that the torque limits in 4-16 Torque Limit Motor Mode and 4-17 Torque Limit Generator Mode are set lower than the current limit in 4-18 Current Limit. Also it is recommendable to set 14-25 Trip Delay at Torque Limit to "0", 14-26 Trip Delay at Inverter Fault to " 0 " and $14-10$ Mains Failure to "[3], Coasting".

### 3.9.2 Hoist Mechanical Brake

The VLT AutomationDrive features a mechanical brake control specifically designed for hoisting applications. The hoist mechanical brake is activated by choice [6] in 1-72 Start Function. The main difference comed to the regular mechanical brake control, where a relay function monitoring the output current is used, is that the hoist mechanical brake function has direct control over the brake relay. This means that instead of setting a current for release of the brake, the torque applied against the closed brake before release is defined. Because the torque is defined directly the setup is more straightforward for hoisting applications.

By using 2-28 Gain Boost Factor a quicker control when releasing the brake can be obtained. The hoist mechanical brake strategy is based on a 3 -step sequence, where motor control and brake release are synchronized in order to obtain the smoothest possible brake release.

## 3-step sequence

1. Pre-magnetize the motor

In order to ensure that there is a hold on the motor and to verify that it is mounted correctly, the motor is first pre-magnetized.
2. Apply torque against the closed brake When the load is held by the mechanical brake, its size cannot be determined, only its direction. The moment the brake opens, the load must be taken over by the motor. To facilitate the takeover, a user defined torque, set in 2-26 Torque Ref, is applied in hoisting direction. This will be used to initialize the speed controller that will finally take over the load. In order to reduce wear on the gearbox due to backlash, the torque is ramped up.
3. Release brake

When the torque reaches the value set in 2-26 Torque Ref the brake is released. The value set in 2-25 Brake Release Time determines the delay before the load is released. In order to react as quickly as possible on the load-step that follows upon brake release, the speed-PID control can be boosted by increasing the proportional gain.

Illustration 3.14 Brake release sequence for hoist mechanical brake control
I) Activate brake delay: The frequency converter starts again from the mechanical brake engaged position.
II) Stop delay: When the time between successive starts is shorter than the setting in 2-24 Stop Delay, the frequency converter starts without applying the mechanical brake (e.g. reversing).

## NOTE

For an example of advanced mechanical brake control for hoisting applications, see section Application Examples

### 3.9.3 Brake Resistor Cabling

EMC (twisted cables/shielding)
To reduce the electrical noise from the wires between the brake resistor and the frequency converter, the wires must be twisted.

For enhanced EMC performance a metal screen can be used.

### 3.10 Smart Logic Controller

Smart Logic Control (SLC) is essentially a sequence of user defined actions (see 13-52 SL Controller Action [x]) executed by the SLC when the associated user defined event (see 13-51 SL Controller Event [x]) is evaluated as TRUE by the SLC.
The condition for an event can be a particular status or that the output from a Logic Rule or a Comparator Operand becomes TRUE. That will lead to an associated Action as illustrated:

Events and actions are each numbered and linked together in pairs (states). This means that when event [0] is fulfilled (attains the value TRUE), action [ 0 ] is executed. After this, the conditions of event [1] will be evaluated and if evaluated TRUE, action [1] will be executed and so on. Only one event will be evaluated at any time. If an event is

Introduction to FC 300
evaluated as FALSE, nothing happens (in the SLC) during the current scan interval and no other events will be evaluated. This means that when the SLC starts, it evaluates event [0] (and only event [0]) each scan interval. Only when event $[0]$ is evaluated TRUE, will the SLC execute action [0] and start evaluating event [1]. It is possible to programme from 1 to 20 events and actions. When the last event / action has been executed, the sequence starts over again from event [0] / action [0]. The illustration shows an example with three event / actions:

## Comparators

Comparators are used for comparing continuous variables (i.e. output frequency, output current, analog input etc.) to fixed preset values.

## Logic Rules

Combine up to three boolean inputs (TRUE / FALSE inputs) from timers, comparators, digital inputs, status bits and events using the logical operators AND, OR, and NOT.

## Application Example

Table 3.9 Using SLC to Set a Relay

### 3.11 Extreme Running Conditions

## Short Circuit (Motor Phase - Phase)

The frequency converter is protected against short circuits by means of current measurement in each of the three motor phases or in the DC link. A short circuit between two output phases will cause an overcurrent in the inverter. The inverter will be turned off individually when the short circuit current exceeds the permitted value (Alarm 16 Trip Lock).
To protect the frequency converter against a short circuit at the load sharing and brake outputs please see the design guidelines.
See certificate in 3.9 Certificates.

## Switching on the Output

Switching on the output between the motor and the frequency converter is fully permitted. You cannot damage the frequency converter in any way by switching on the output. However, fault messages may appear.

## Motor-generated Over-voltage

The voltage in the intermediate circuit is increased when the motor acts as a generator. This occurs in following cases:

1. The load drives the motor (at constant output frequency from the frequency converter), ie. the load generates energy.
2. During deceleration ("ramp-down") if the moment of inertia is high, the friction is low and the rampdown time is too short for the energy to be dissipated as a loss in the frequency converter, the motor and the installation.
3. Incorrect slip compensation setting may cause higher DC link voltage.

The control unit may attempt to correct the ramp if possible (2-17 Over-voltage Control.
The inverter turns off to protect the transistors and the intermediate circuit capacitors when a certain voltage level is reached.
See 2-10 Brake Function and 2-17 Over-voltage Control to select the method used for controlling the intermediate circuit voltage level.

## Mains Drop-out

During a mains drop-out, the frequency converter keeps running until the intermediate circuit voltage drops below the minimum stop level, which is typically $15 \%$ below the frequency converter's lowest rated supply voltage. The mains voltage before the drop-out and the motor load determines how long it takes for the inverter to coast.

## Static Overload in VVC ${ }^{\text {plus }}$ mode

When the frequency converter is overloaded (the torque limit in 4-16 Torque Limit Motor Mode/4-17 Torque Limit Generator Mode is reached), the controls reduces the output frequency to reduce the load.
If the overload is excessive, a current may occur that makes the frequency converter cut out after approx. 5-10 sec.

Operation within the torque limit is limited in time (0-60 sec.) in 14-25 Trip Delay at Torque Limit.

### 3.11.1 Motor Thermal Protection

To protect the application from serious damages VLT AutomationDrive offers several dedicated features

Torque Limit: The Torque limit feature the motor is protected for being overloaded independent of the speed. Torque limit is controlled in 4-16 Torque Limit Motor Mode and or 4-17 Torque Limit Generator Mode and the time before the torque limit warning shall trip is controlled in 14-25 Trip Delay at Torque Limit.
Current Limit: The current limit is controlled in 4-18 Current Limit and the time before the current limit warning shall trip is controlled in 14-24 Trip Delay at Current Limit.
Min Speed Limit: (4-11 Motor Speed Low Limit [RPM] or 4-12 Motor Speed Low Limit [Hz]) limit the operating speed range to for instance between 30 and $50 / 60 \mathrm{~Hz}$. Max Speed Limit: (4-13 Motor Speed High Limit [RPM] or 4-19 Max Output Frequency) limit the max output speed the drive can provide
ETR (Electronic Thermal relay): The frequency converter ETR function measures actual current, speed and time to calculate motor temperature and protect the motor from being overheated (Warning or trip). An external thermistor input is also available. ETR is an electronic feature that simulates a bimetal relay based on internal measurements. The characteristic is shown in the following figure:

Illustration 3.15 Figure ETR: The X-axis shows the ratio between $I_{\text {motor }}$ and $I_{\text {motor }}$ nominal. The $Y$ - axis shows the time in seconds before the ETR cut of and trips the drive. The curves show the characteristic nominal speed, at twice the nominal speed and at $0,2 \times$ the nominal speed.
At lower speed the ETR cuts of at lower heat due to less cooling of the motor. In that way the motor are protected from being over heated even at low speed. The ETR feature is calculating the motor temperature based on actual current and speed. The calculated temperature is visible as a read out parameter in 16-18 Motor Thermal in the FC 300.

### 3.12 Safe Stop of FC 300

The FC 302, and also the FC 301 in A1 enclosure, can perform the safety function Safe Torque Off (STO, as defined by EN IEC 61800-5-2 ${ }^{1}$ ) and Stop Category 0 (as defined in EN 60204-1²).
Danfoss has named this functionality Safe Stop. Prior to integration and use of Safe Stop in an installation, a thorough risk analysis on the installation must be carried out in order to determine whether the Safe Stop functionality and safety levels are appropriate and sufficient. It is designed and approved suitable for the requirements of :

- $\quad$ Safety Category 3 in EN 954-1 (and EN ISO 13849-1)
- $\quad$ Performance Level "d" in EN ISO 13849-1:2008
- SIL 2 Capability in IEC 61508 and EN 61800-5-2
- SILCL 2 in EN 62061

1) Refer to EN IEC 61800-5-2 for details of Safe torque off (STO) function.
2) Refer to EN IEC 60204-1 for details of stop category 0 and 1.
Activation and Termination of Safe Stop
The Safe Stop (STO) function is activated by removing the voltage at Terminal 37 of the Safe Inverter. By connecting the Safe Inverter to external safety devices providing a safe delay, an installation for a safe Stop Category 1 can be obtained. The Safe Stop function of FC 302 can be used for asynchronous, synchronous motors and permanent magnet motors. See examples in 3.8.1 Terminal 37 Safe Stop Function.

## NOTE

FC 301 A1 enclosure: When Safe Stop is included in the drive, position 18 of Type Code must be either $T$ or $U$. If position 18 is B or X, Safe Stop Terminal 37 is not included! Example:
Type Code for FC 301 A1 with Safe Stop:
FC-301PK75T4Z20H4TGCXXXSXXXXAOBXCXXXXD0

## AWARNING

After installation of Safe Stop (STO), a commissioning test as specified in section Safe Stop Commissioning Test of the Design Guide must be performed. A passed commissioning test is mandatory after first installation and after each change to the safety installation.

## Safe Stop Technical Data

The following values are associated to the different types of safety levels:

## Reaction time for T37

- Typical reaction time: 10 ms

Reaction time = delay between de-energizing the STO input and switching off the drive output bridge.

## Data for EN ISO 13849-1

- Performance Level "d"
- $\quad$ MTTFd (Mean Time To Dangerous Failure): 24816 years
- DC (Diagnstic Coverage): 99\%
- Category 3
- Lifetime 20 years

Data for EN IEC 62061, EN IEC 61508, EN IEC 61800-5-2

- SIL 2 Capability, SILCL 2
- PFH (Probability of Dangerous failure per Hour) = 7e-10FIT = 7e-19/h
- SFF (Safe Failure Fraction) > 99\%
- $\quad$ HFT (Hardware Fault Tolerance) $=0$ ( 1001 architecture)
- Lifetime 20 years

Data for EN IEC 61508 low demand

- PFDavg for 1 year proof test: 3,07E-14
- PFDavg for 3 year proof test: 9,20E-14
- PFDavg for 5 year proof test: $1,53 \mathrm{E}-13$

## SISTEMA Data

From Danfoss Functional safety data is available via a data library for use with the SISTEMA calculation tool from the IFA (Institute for Occupational Safety and Health of the German Social Accident Insurance), and data for manual calculation. The library is permanently completed and extended.

Introduction to FC 300

Abbreviations related to Functional Safety

| Abbrev. | Ref. | Description |
| :---: | :---: | :---: |
| Cat. | $\begin{array}{\|l\|} \hline \mathrm{EN} \\ 954-1 \end{array}$ | Category, level "B, 1-4" |
| FIT |  | Failure In Time: 1E-9 hours |
| HFT | $\begin{array}{\|l\|} \hline \text { IEC } \\ 61508 \end{array}$ | Hardware Fault Tolerance: HFT = n means, that $\mathrm{n}+1$ faults could cause a loss of the safety function |
| MTTFd | $\begin{array}{\|l} \hline \text { EN } \\ \text { ISO } \\ 13849 \\ -1 \end{array}$ | Mean Time To Failure - dangerous. Unit: years |
| PFH | IEC $61508$ | Probability of Dangerous Failures per Hour. This value shall be considered if the safety device is operated in high demand (more often than once per year) or continuous mode of operation, where the frequency of demands for operation made on a safety-related system is greater than one per year |
| PL | $\begin{array}{\|l} \hline \text { EN } \\ \text { ISO } \\ 13849 \\ -1 \end{array}$ | Discrete level used to specify the ability of safety related parts of control systems to perform a safety function under foreseeable conditions. Levels a-e |
| SFF | IEC $61508$ | Safe Failure Fraction [\%] ; Percentage part of safe failures and dangerous detected failures of a safety function or a subsystem related to all failures. |
| SIL | IEC $61508$ | Safety Integrity Level |
| STO | $\begin{array}{\|l\|} \hline \text { EN } \\ 61800 \\ -5-2 \\ \hline \end{array}$ | Safe Torque Off |
| SS1 | $\begin{array}{\|l\|} \hline \text { EN } \\ 61800 \\ -5-2 \end{array}$ | Safe Stop 1 |

The PFDavg value (Probability of Failure on Demand) Failure probability in the event of a request of the safety function.

### 3.12.1 Terminal 37 Safe Stop Function

The FC 302 and FC 301 (optional for A1 enclosure) is available with safe stop functionality via control terminal 37. Safe stop disables the control voltage of the power semiconductors of the frequency converter output stage which in turn prevents generating the voltage required to rotate the motor. When the Safe Stop (T37) is activated, the frequency converter issues an alarm, trips the unit, and coasts the motor to a stop. Manual restart is required. The safe stop function can be used for stopping the frequency converter in emergency stop situations. In the normal operating mode when safe stop is not required, use the frequency converter's regular stop function instead. When automatic restart is used - the requirements according to ISO 12100-2 paragraph 5.3.2.5 must be fulfilled.

## Liability Conditions

It is the responsibility of the user to ensure personnel installing and operating the Safe Stop function:

- Read and understand the safety regulations concerning health and safety/accident prevention
- Understand the generic and safety guidelines given in this description and the extended description in the Design Guide
- Have a good knowledge of the generic and safety standards applicable to the specific application

User is defined as: integrator, operator, servicing, maintenance staff.

## Standards

Use of safe stop on terminal 37 requires that the user satisfies all provisions for safety including relevant laws, regulations and guidelines. The optional safe stop function complies with the following standards.

EN 954-1: 1996 Category 3
IEC 60204-1: 2005 category 0 - uncontrolled stop
IEC 61508: 1998 SIL2
IEC 61800-5-2: 2007 - safe torque off (STO) function

IEC 62061: 2005 SIL CL2
ISO 13849-1: 2006 Category 3 PL d
ISO 14118: 2000 (EN 1037) - prevention of unexpected start up

The information and instructions of the instruction manual are not sufficient for a proper and safe use of the safe stop functionality. The related information and instructions of the relevant Design Guide must be followed.

## Protective Measures

- Safety engineering systems may only be installed and commissioned by qualified and skilled personnel
- The unit must be installed in an IP54 cabinet or in an equivalent environment. In special applications a higher IP degree may be necessary
- The cable between terminal 37 and the external safety device must be short circuit protected according to ISO 13849-2 table D. 4
- If any external forces influence the motor axis (e.g. suspended loads), additional measures (e.g., a safety holding brake) are required in order to eliminate hazards

## Safe Stop Installation and Set-Up

## -WARNING

## SAFE STOP FUNCTION!

The safe stop function does NOT isolate mains voltage to the frequency converter or auxiliary circuits. Perform work on electrical parts of the frequency converter or the motor only after isolating the mains voltage supply and waiting the length of time specified under Safety in this manual. Failure to isolate the mains voltage supply from the unit and waiting the time specified could result in death or serious injury.

- It is not recommended to stop the frequency converter by using the Safe Torque Off function. If a running frequency converter is stopped by using the function, the unit will trip and stop by coasting. If this is not acceptable, e.g. causes danger, the frequency converter and machinery must be stopped using the appropriate stopping mode before using this function. Depending on the application a mechanical brake may be required.
- Concerning synchronous and permanent magnet motor frequency converters in case of a multiple IGBT power semiconductor failure: In spite of the activation of the Safe torque off function, the frequency converter system can produce an alignment torque which maximally rotates the motor shaft by 180/p degrees. p denotes the pole pair number.
- This function is suitable for performing mechanical work on the frequency converter system or affected area of a machine only. It does not provide electrical safety. This function should not be used as a control for starting and/or stopping the frequency converter.

The following requirements have to be meet to perform a safe installation of the frequency converter:

1. Remove the jumper wire between control terminals 37 and 12 or 13 . Cutting or breaking the jumper is not sufficient to avoid shortcircuiting. (See jumper on Illustration 3.16.)
2. Connect an external Safety monitoring relay via a NO safety function (the instruction for the safety device must be followed) to terminal 37 (safe stop) and either terminal 12 or 13 ( 24 V DC). The Safety monitoring relay must comply with Category 3 (EN 954-1) / PL "d" (ISO 13849-1) or SIL 2 (EN 62061).

Illustration 3.16 Jumper between Terminal 12/13 (24V) and 37

Illustration 3.17 Installation to Achieve a Stopping Category 0 (EN 60204-1) with Safety Cat. 3 (EN 954-1) / PL "d" (ISO 13849-1) or SIL 2 (EN 62061).

| 1 | Safety relay (cat. 3, PL d or SIL2 |
| :--- | :--- |
| 2 | Emergency stop button |
| 3 | Reset button |
| 4 | Short-circuit protected cable (if not inside installation IP54 <br> cabinet) |

## Safe Stop Commissioning Test

After installation and before first operation, perform a commissioning test of the installation making use of safe stop. Moreover, perform the test after each modification of the installation.

## Example with STO

A safety relay evaluates the E-Stop button signals and triggers an STO function on the frequency converter in the event of an activation of the E-Stop button (See Illustration 3.18). This safety function corresponds to a category 0 stop (uncontrolled stop) in accordance with IEC 60204-1. If the function is triggered during operation, the motor will run down in an uncontrolled manner. The power to the motor is safely removed, so that no further movement is possible. It is not necessary to monitor plant at a standstill. If an external force effect is to be anticipated, additional measures should be provided to safely prevent any potential movement (e.g. mechanical brakes).

## NOTE

For all applications with Safe Stop it is important that short circuit in the wiring to T37 can be excluded. This can be done as described in EN ISO 13849-2 D4 by the use of protected wiring, (shielded or segregated).

## Example with SS1

SS1 correspond to a controlled stop, stop category 1 according to IEC 60204-1 (see Illustration 3.19). When activating the safety function a normal controlled stop will be performed. This can be activated through terminal 27. After the safe delay time has expired on the external safety module, the STO will be triggered and terminal 37 will be set low. Ramp down will be performed as configured in the drive. If drive is not stopped after the safe delay time the activation of STO will coast the frequency converter.

## NOTE

When using the SS1 function, the brake ramp of the drive is not monitored with respect to safety.

## Example with Category 4/PL e application

Where the safety control system design requires two channels for the STO function to achieve Category 4 / PL e, one channel can be implemented by Safe Stop T37 (STO) and the other by a contactor, which may be connected in either the drive input or output power circuits and controlled by the Safety relay (see Illustration 3.20). The contactor must be monitored through an auxiliary guided contact, and connected to the reset input of the Safety Relay.
Paralleling of Safe Stop input the one Safety Relay Safe Stop inputs T37 (STO) may be connected directly together if it is required to control multiple drives from the same control line via one Safety Relay (see Illustration 3.21). Connecting inputs together increases the probability of a fault in the unsafe direction, since a fault in one drive might result in all drives becoming enabled. The probability of a fault for T37 is so low, that the resulting probability still meets the requirements for SIL2.

Illustration 3.18 STO example

Illustration 3.19 SS1 example

Illustration 3.20 STO category 4 example

| 1 | Safety relay |

Illustration 3.21 Paralleling of multiple drives example

| 1 | Safety relay |
| :--- | :--- |
| 2 | Emergency stop button |
| 3 | Reset button |
| 4 | 24 V DC |

## AWARNING

Safe Stop activation (i.e. removal of 24 V DC voltage supply to terminal 37) does not provide electrical safety. The Safe Stop function itself is therefore not sufficient to implement the Emergency-Off function as defined by EN 60204-1.
Emergency-Off requires measures of electrical isolation, e.g. by switching off mains via an additional contactor.

1. Activate the Safe Stop function by removing the 24 V DC voltage supply to the terminal 37.
2. After activation of Safe Stop (i.e. after the response time), the frequency converter coasts (stops creating a rotational field in the motor). The response time is typically shorter than 10 ms for the complete performance range of FC 302.

The frequency converter is guaranteed not to restart creation of a rotational field by an internal fault (in accordance with Cat. 3 of EN 954-1, PL d acc. EN ISO 13849-1 and SIL 2 acc. EN 62061). After activation of Safe Stop, the FC 302 display will show the text Safe Stop activated. The associated help text says "Safe Stop has been activated. This means that the Safe Stop has been activated, or that normal operation has not been resumed yet after Safe Stop activation.

## NOTE

The requirements of Cat. 3 (EN 954-1)/PL "d" (ISO 13849-1) are only fulfilled while 24 V DC supply to terminal 37 is kept removed or low by a safety device which itself fulfills Cat. 3 (EN 954-1) / PL "d" (ISO 13849-1). If external forces act on the motor e.g. in case of vertical axis (suspended loads) - and an unwanted movement, for example caused by gravity, could cause a hazard, the motor must not be operated without additional measures for fall protection. E.g. mechanical brakes must be installed additionally.

In order to resume operation after activation of Safe Stop, first 24 V DC voltage must be reapplied to terminal 37 (text Safe Stop activated is still displayed), second a Reset signal must be created (via bus, Digital I/O, or [Reset] key on inverter).

By default the Safe Stop functions is set to an Unintended Restart Prevention behaviour. This means, in order to terminate Safe Stop and resume normal operation, first the 24V DC must be reapplied to Terminal 37. Subsequently, a reset signal must be given (via Bus, Digital I/O, or [Reset] key).

The Safe Stop function can be set to an Automatic Restart behaviour by setting the value of 5-19 Terminal 37 Safe Stop from default value [1] to value [3]. If a MCB 112 Option is connected to the drive, then Automatic Restart Behaviour is set by values [7] and [8].

Automatic Restart means that Safe Stop is terminated, and normal operation is resumed, as soon as the 24 V DC are applied to Terminal 37, no Reset signal is required.

## $\triangle$ WARNING

Automatic Restart Behaviour is only allowed in one of the two situations:

1. The Unintended Restart Prevention is implemented by other parts of the Safe Stop installation.
2. A presence in the dangerous zone can be physically excluded when Safe Stop is not activated. In particular, paragraph 5.3.2.5 of ISO 12100-2 2003 must be observed

### 3.12.2 Installation of External Safety Device in Combination with MCB 112

If the Ex-certified thermistor module MCB 112, which uses Terminal 37 as its safety-related switch-off channel, is connected, then the output X44/12 of MCB 112 must be AND-ed with the safety-related sensor (such as emergency stop button, safety-guard switch, etc.) that activates Safe Stop. This means that the output to Safe Stop terminal 37 is HIGH ( 24 V ) only if both the signal from MCB 112 output X44/12 and the signal from the safety-related sensor are HIGH. If at least one of the two signals is LOW, then the output to Terminal 37 must be LOW, too. The safety device with this AND logic itself must conform to IEC 61508, SIL 2. The connection from the output of the safety device with safe AND logic to Safe Stop terminal 37 must be shortcircuit protected. See Illustration 3.22.

Illustration 3.22 Illustration of the essential aspects for installing a combination of a Safe Stop application and a MCB 112 application. The diagram shows a Restart input for the external Safety Device. This means that in this installation 5-19 Terminal 37 Safe Stop might be set to value [7] or [8]. Refer to MCB 112 operating instuctions, MG.33.VX.YY for further details.

## Parameter settings for external safety device in combination with MCB112

If MCB 112 is connected, then additional selections ([4] [9]) become possible for par. 5-19 (Terminal 37 Safe Stop). Selection [1]* and [3] are still available but are not to be used as those are for installations without MCB 112 or any external safety devices. If [1]* or [3] should be chosen by mistake and MCB 112 is triggered, then the frequency converter will react with an alarm "Dangerous Failure [A72]" and coast the drive safely, without Automatic Restart. Selections [4] and [5] are not to be selected when an external safety device is used. Those selections are for when only MCB 112 uses the Safe Stop. If selections [4] or [5] are chosen by mistake and the external safety device triggers Safe Stop then the frequency converter will react with an alarm "Dangerous Failure [A72]" and coast the drive safely, without Automatic Restart.
Selections [6] - [9] must be chosen for the combination of external safety device and MCB 112.

## NOTE

Note that selection [7] and [8] opens up for Automatic restart when the external safety device is de-activated again.

This is only allowed in the following cases:

1. The Unintended Restart Prevention is implemented by other parts of the Safe Stop installation.
2. A presence in the dangerous zone can be physically excluded when Safe Stop is not activated. In particular, paragraph 5.3.2.5 of ISO 12100-2 2003 must be observed.

See10.6 MCB 112 PTC Thermistor Card and the operating instructions for the MCB 112 for further information.

### 3.12.3 Safe Stop Commissioning Test

After installation and before first operation, perform a commissioning test of an installation or application making use of FC 300 Safe Stop.
Moreover, perform the test after each modification of the installation or application, which the FC 300 Safe Stop is part of.

## NOTE

A passed commissioning test is mandatory after first installation and after each change to the safety installation.

The commissioning test (select one of cases 1 or 2 as applicable):

Case 1: restart prevention for Safe Stop is required (i.e. Safe Stop only where 5-19 Terminal 37 Safe Stop is set to default value [1], or combined Safe Stop and MCB112 where 5-19 Terminal 37 Safe Stop is set to [6] or [9]):
1.1 Remove the 24 V DC voltage supply to terminal 37 by the interrupt device while the motor is driven by the FC 302 (i.e. mains supply is not interrupted). The test step is passed if the motor reacts with a coast and the mechanical brake (if connected) is activated, and if an LCP is mounted, the alarm "Safe Stop [A68]" is displayed.
1.2 Send Reset signal (via Bus, Digital I/O, or [Reset] key). The test step is passed if the motor remains in the Safe Stop state, and the mechanical brake (if connected) remains activated.
1.3 Reapply 24 V DC to terminal 37 . The test step is passed if the motor remains in the coasted state, and the mechanical brake (if connected) remains activated.
1.4 Send Reset signal (via Bus, Digital I/O, or [Reset] key). The test step is passed if the motor becomes operational again.

The commissioning test is passed if all four test steps 1.1, 1.2, 1.3 and 1.4 are passed.

Case 2: Automatic Restart of Safe Stop is wanted and allowed (i.e. Safe Stop only where 5-19 Terminal 37 Safe Stop is set to [3], or combined Safe Stop and MCB112 where 5-19 Terminal 37 Safe Stop is set to [7] or [8]):
2.1 Remove the 24V DC voltage supply to terminal 37 by the interrupt device while the motor is driven by the FC 302 (i.e. mains supply is not interrupted). The test step is passed if the motor reacts with a coast and the mechanical brake (if connected) is activated, and if an LCP is mounted, the warning "Safe Stop [W68]" is displayed.
2.2 Reapply 24V DC to terminal 37.

The test step is passed if the motor becomes operational again. The commissioning test is passed if all two test steps 2.1 and 2.2 are passed.

## NOTE

See warning on the restart behaviour in 3.8.1 Terminal 37 Safe Stop Function

## NOTE

The Safe Stop function of FC 302 can be used for asynchronous, synchronous and permanent magnet motors. It may happen that two faults occur in the frequency converter's power semiconductor. When using synchronous or permanent magnet motors this may cause a residual rotation. The rotation can be calculated to Angle=360/(Number of Poles). The application using synchronous or permanent magnet motors must take this into consideration and ensure that this is not a safety critical issue. This situation is not relevant for asynchronous motors.

```

covered by this certificate are short circuit protected and meets the requirements in IEC61800-5-1 $2^{\text {nd }}$ edition clause 5.2.3.6.3, if the product is used and installedaccording to our instructions. The short circuit protection will operate within $20 \mu \mathrm{~S}$ in case of a full short circuit from motor output terminal to protective earth.

For fuse ratings, see 8.3.1 Fuses

1) High overload $=160 \%$ torque during 60 sec., Normal overload $=110 \%$ torque during 60 sec.
2) American Wire Gauge.
3) Measured using 5 m screened motor cables at rated load and rated frequency.
4) The typical power loss is at nominal load conditions and expected to be within $+/-15 \%$ (tolerence relates to variety in voltage and cable conditions).
Values are based on a typical motor efficiency (eff2/eff3 border line). Motors with lower efficiency will also add to the power loss in the frequency converter and opposite.
If the switching frequency is increased compared to the default setting, the power losses may rise significantly.
LCP and typical control card power consumptions are included. Further options and customer load may add up to 30W to the losses. (Though typical only $4 W$ extra for a fully loaded control card, or options for slot $A$ or slot $B$, each).
Although measurements are made with state of the art equipment, some measurement inaccuracy must be allowed for ( $+/-5 \%$ ).
5) The three values for the max. cable cross section are for single core, flexible wire and flexible wire with sleeve, respectively.

## For fuse ratings, see 8.3.1 Fuses

1) High overload $=160 \%$ torque during 60 sec., Normal overload $=110 \%$ torque during 60 sec.
2) American Wire Gauge.
3) Measured using 5 m screened motor cables at rated load and rated frequency.
4) The typical power loss is at nominal load conditions and expected to be within $+/-15 \%$ (tolerence relates to variety in voltage and cable conditions).
Values are based on a typical motor efficiency (eff2/eff3 border line). Motors with lower efficiency will also add to the power loss in the frequency converter and opposite.
If the switching frequency is increased compared to the default setting, the power losses may rise significantly.
LCP and typical control card power consumptions are included. Further options and customer load may add up to 30W to the losses. (Though typical only 4W extra for a fully loaded control card, or options for slot $A$ or slot $B$, each).
Although measurements are made with state of the art equipment, some measurement inaccuracy must be allowed for ( $+/-5 \%$ ).
5) The three values for the max. cable cross section are for single core, flexible wire and flexible wire with sleeve, respectively.

For fuse ratings, see 8.3.1 Fuses

1) High overload $=160 \%$ torque during 60 sec., Normal overload $=110 \%$ torque during 60 sec.
2) American Wire Gauge.
3) Measured using 5 m screened motor cables at rated load and rated frequency.
4) The typical power loss is at nominal load conditions and expected to be within $+/-15 \%$ (tolerence relates to variety in voltage and cable conditions).
Values are based on a typical motor efficiency (eff2/eff3 border line). Motors with lower efficiency will also add to the power loss in the frequency converter and opposite.
If the switching frequency is increased compared to the default setting, the power losses may rise significantly.
LCP and typical control card power consumptions are included. Further options and customer load may add up to 30W to the losses. (Though typical only 4W extra for a fully loaded control card, or options for slot $A$ or slot $B$, each).
Although measurements are made with state of the art equipment, some measurement inaccuracy must be allowed for ( $+/-5 \%$ ).
5) The three values for the max. cable cross section are for single core, flexible wire and flexible wire with sleeve, respectively.

| * High overload $=160 \%$ torque during 60 sec ., Normal overload $=110 \%$ torque during 60 sec . |  |  |  |  |  |  |  |

1) For type of fuse see section Fuses.
2) American Wire Gauge.
3) Measured using 5 m screened motor cables at rated load and rated frequency.
4) The typical power loss is at nominal load conditions and expected to be within $+/-15 \%$ (tolerence relates to variety in voltage and cable conditions).
Values are based on a typical motor efficiency (eff2/eff3 border line). Motors with lower efficiency will also add to the power loss in the frequency converter and opposite.
If the switching frequency is increased compared to the default setting, the power losses may rise significantly. LCP and typical control card power consumptions are included. Further options and customer load may add up to 30 W to the losses. (Though typical only 4W extra for a fully loaded control card, or options for slot A or slot B, each).

FC 300 Selection
FC 300 Design Guide

Although measurements are made with state of the art equipment, some measurement inaccuracy must be allowed for (+/-5\%).

| * High overload $=160 \%$ torque during 60 sec., Normal overload $=110 \%$ torque during 60 sec . |  |  |  |  |  |  |

1) For type of fuse see section Fuses.
2) American Wire Gauge.
3) Measured using 5 m screened motor cables at rated load and rated frequency.
4) The typical power loss is at nominal load conditions and expected to be within $+/-15 \%$ (tolerence relates to variety in voltage and cable conditions).
Values are based on a typical motor efficiency (eff2/eff3 border line). Motors with lower efficiency will also add to the power loss in the frequency converter and opposite.
If the switching frequency is increased compared to the default setting, the power losses may rise significantly. LCP and typical control card power consumptions are included. Further options and customer load may add up to 30 W to the losses. (Though typical only 4W extra for a fully loaded control card, or options for slot A or slot B, each).
Although measurements are made with state of the art equipment, some measurement inaccuracy must be allowed for (+/-5\%).

### 4.5 General Specifications

Mains supply:
Supply Terminals (6-Pulse)
Supply Terminals (12-Pulse)
Supply voltage
Supply voltage
Supply voltage

## Mains voltage low / mains drop-out:

During low mains voltage or a mains drop-out, the FC continues until the intermediate circuit voltage drops below the minimum stop level, which corresponds typically to $15 \%$ below the frequency converter's lowest rated supply voltage. Power-up and full torque cannot be expected at mains voltage lower than $10 \%$ below the frequency converter's lowest rated supply voltage.

| Supply frequency | $50 / 60 \mathrm{~Hz} \pm 5 \%$ |
| :---: | :---: |
| Max. imbalance temporary between mains phases | $3.0 \%$ of rated supply voltage |
| True Power Factor ( $\lambda$ ) | $\geq 0.9$ nominal at rated load |
| Displacement Power Factor ( $\cos \phi$ ) | near unity ( $>0.98$ ) |
| Switching on input supply L1, L2, L3 (power-ups) $\leq 7.5 \mathrm{~kW}$ | maximum 2 times/min. |
| Switching on input supply L1, L2, L3 (power-ups) $11-75 \mathrm{~kW}$ | maximum 1 time/min. |
| Switching on input supply L1, L2, L3 (power-ups) $\geq 90 \mathrm{~kW}$ | maximum 1 time/2 min. |
| Environment according to EN60664-1 | overvoltage category III/pollution degree 2 |
| The unit is suitable for use on a circuit capable of delivering not more than 100,000 RMS symmetrical Amperes, 240/500/600/ 690 V maximum. |  |
| Motor output (U, V, W): |  |
| Output voltage | 0-100\% of supply voltage |
| Output frequency (0.25-75kW) | FC 301: $0.2-1000 \mathrm{~Hz} / \mathrm{FC} 302: 0-1000 \mathrm{~Hz}$ |
| Output frequency (90-1000kW) | $0-800{ }^{1 /} \mathrm{Hz}$ |
| Output frequency in Flux Mode (FC 302 only) | $0-300 \mathrm{~Hz}$ |
| Switching on output | Unlimited |
| Ramp times | 0.01-3600sec. |

${ }^{1)}$ Voltage and power dependent
Torque characteristics:

${ }^{1)}$ For power cables, see electrical data tables.
Protection and Features:

- Electronic thermal motor protection against overload.
- Temperature monitoring of the heatsink ensures that the frequency converter trips if the temperature reaches a predefined level. An overload temperature cannot be reset until the temperature of the heatsink is below the values stated in the tables on the following pages (Guideline - these temperatures may vary for different power sizes, frame sizes, enclosure ratings etc.).
- The frequency converter is protected against short-circuits on motor terminals $\mathrm{U}, \mathrm{V}, \mathrm{W}$.
- If a mains phase is missing, the frequency converter trips or issues a warning (depending on the load).
- Monitoring of the intermediate circuit voltage ensures that the frequency converter trips if the intermediate circuit voltage is too low or too high.
- The frequency converter constantly checks for critical levels of internal temperature, load current, high voltage on the intermediate circuit and low motor speeds. As a response to a critical level, the frequency converter can adjust the switching frequency and/ or change the switching pattern in order to ensure the performance of the frequency converter.

Digital inputs:

| Programmable digital inputs | FC 301: 4 (5) ${ }^{1)} / \mathrm{FC} 302: 4(6)^{11}$ |
| :---: | :---: |
| Terminal number | 18, 19, 271), 291), 32, 33, |
| Logic | PNP or NPN |
| Voltage level | 0-24V DC |
| Voltage level, logic'0' PNP | < 5V DC |
| Voltage level, logic'1' PNP | $>10 \mathrm{VDC}$ |
| Voltage level, logic '0' NPN ${ }^{2}$ ) | $>19 \mathrm{VDC}$ |
| Voltage level, logic '1' NPN ${ }^{2}$ ) | < 14V DC |
| Maximum voltage on input | 28V DC |
| Pulse frequency range | 0-110kHz |
| (Duty cycle) Min. pulse width | 4.5 ms |
| Input resistance, $\mathrm{R}_{\mathrm{i}}$ | approx. $4 \mathrm{k} \Omega$ |
| Safe stop Terminal 373,4) (Terminal 37 is fixed PNP logic): |  |
| Voltage level | 0-24V DC |
| Voltage level, logic'0' PNP | < 4V DC |
| Voltage level, logic'1' PNP | >20V DC |
| Maximum voltage on input | 28 V DC |
| Typical input current at 24 V | 50 mA rms |
| Typical input current at 20V | 60 mA rms |
| Input capacitance | 400nF |

All digital inputs are galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.
${ }^{1)}$ Terminals 27 and 29 can also be programmed as output.
2) Except safe stop input Terminal 37.
${ }^{3)}$ See 3.8 Safe Stop of for further information about terminal 37 and Safe Stop.
4) When using a contactor with a DC coil inside in combination with Safe Stop, it is important to make a return way for the current from the coil when turning it off. This can be done by using a freewheel diode (or, alternatively, a 30 or 50 V MOV for quicker response time) across the coil. Typical contactors can be bought with this diode.
Analog inputs:
Number of analog inputs
Terminal number
Modes
Mode select
Voltage mode
Voltage level
Input resistance, $R_{i}$
Max. voltage
Current mode
Current level
Input resistance, $R_{i}$
Max. current
Resolution for analog inputs
Accuracy of analog inputs

The analog inputs are galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

Pulse/encoder inputs:

| Programmable pulse/encoder inputs | 2/1 |
| :---: | :---: |
| Terminal number pulse/encoder | 291), 33 ${ }^{2 \prime} / 32^{3)}, 33^{31}$ |
| Max. frequency at terminal 29,32,33 | 110 kHz (Push-pull driven) |
| Max. frequency at terminal 29, 32, 33 | 5 kHz (open collector) |
| Min. frequency at terminal 29, 32, 33 | 4 Hz |
| Voltage level | see section on Digital input |
| Maximum voltage on input | 28 V DC |
| Input resistance, $\mathrm{R}_{\mathrm{i}}$ | approx. $4 \mathrm{k} \Omega$ |
| Pulse input accuracy ( $0.1-1 \mathrm{kHz}$ ) | Max. error: $0.1 \%$ of full scale |
| Encoder input accuracy ( $1-11 \mathrm{kHz}$ ) | Max. error: $0.05 \%$ of full scale |
| The pulse and encoder inputs (terminals 29,32,33) are galvanically isolated from the supply voltage (PELV) and other highvoltage terminals. <br> ${ }^{1)}$ FC 302 only <br> 2) Pulse inputs are 29 and 33 <br> ${ }^{3)}$ Encoder inputs: $32=A$, and $33=B$ |  |
| Analog output: |  |
| Number of programmable analog outputs | 1 |
| Terminal number | 42 |
| Current range at analog output | 0/4-20mA |
| Max. load GND - analog output | $500 \Omega$ |
| Accuracy on analog output | Max. error: $0.5 \%$ of full scale |
| Resolution on analog output | 12 bit |

The analogue output is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.
Control card, RS-485 serial communication:
Terminal number
68 (P,TX+, RX+), 69 (N,TX-, RX-)
Terminal number 61 Common for terminals 68 and 69

The RS-485 serial communication circuit is functionally separated from other central circuits and galvanically isolated from the supply voltage (PELV).

Digital output:
Programmable digital/pulse outputs
Terminal number
Voltage level at digital/frequency output
Max. output current (sink or source)
Max. load at frequency output
Max. capacitive load at frequency output
Minimum output frequency at frequency output
Maximum output frequency at frequency output
Accuracy of frequency output
Resolution of frequency outputs
${ }^{1)}$ Terminal 27 and 29 can also be programmed as input.
The digital output is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.
Control card, 24V DC output:
Terminal number
Output voltage
Max. load

The 24V DC supply is galvanically isolated from the supply voltage (PELV), but has the same potential as the analog and digital inputs and outputs.
Relay outputs:
Programmable relay outputs $\quad$ FC 301 all $\mathrm{kW}: 1 / \mathrm{FC} 302$ all $\mathrm{kW}: 2$

Control card, USB serial communication:
USB standard

Connection to PC is carried out via a standard host/device USB cable.
The USB connection is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.
The USB ground connection is not galvanically isolated from protection earth. Use only an isolated laptop as PC connection to the USB connector on the frequency converter.

### 4.6.1 Efficiency

Efficiency of the frequency converter ( $\eta_{v L T}$ )
The load on the frequency converter has little effect on its efficiency. In general, the efficiency is the same at the rated motor frequency $f_{M, N}$, even if the motor supplies $100 \%$ of the rated shaft torque or only $75 \%$, i.e. in case of part loads.

This also means that the efficiency of the frequency converter does not change even if other U/f characteristics are chosen.
However, the U/f characteristics influence the efficiency of the motor.

The efficiency declines a little when the switching frequency is set to a value of above 5 kHz . The efficiency will also be slightly reduced if the mains voltage is 480 V , or if the motor cable is longer than 30 m .

## Frequency converter efficiency calculation

Calculate the efficiency of the frequency converter at different loads based on Illustration 4.1. The factor in this graph must be multiplied with the specific efficiency factor listed in the specification tables:

Illustration 4.1 Typical Efficiency Curves

Example: Assume a $55 \mathrm{~kW}, 380-480 \mathrm{~V}$ AC frequency converter at $25 \%$ load at $50 \%$ speed. The graph is showing 0,97 - rated efficiency for a 55 kW FC is 0.98 . The actual efficiency is then: $0.97 \times 0.98=0.95$.

## Efficiency of the motor (nмотов)

The efficiency of a motor connected to the frequency converter depends on magnetizing level. In general, the efficiency is just as good as with mains operation. The efficiency of the motor depends on the type of motor.

In the range of $75-100 \%$ of the rated torque, the efficiency of the motor is practically constant, both when it is controlled by the frequency converter and when it runs directly on mains.

In small motors, the influence from the U/f characteristic on efficiency is marginal. However, in motors from 11 kW and up, the advantages are significant.

In general, the switching frequency does not affect the efficiency of small motors. Motors from 11 kW and up have their efficiency improved ( $1-2 \%$ ). This is because the sine shape of the motor current is almost perfect at high switching frequency.

## Efficiency of the system ( $\eta_{\text {SYSTEM }}$ )

To calculate the system efficiency, the efficiency of the frequency converter ( $\eta_{V L T}$ ) is multiplied by the efficiency of the motor ( $\eta_{\text {мотов }}$ ):
$\eta_{\text {SYStem }}=\eta_{\text {VLt }} \times$ Пмото

### 4.7.1 Acoustic Noise

The acoustic noise from the frequency converter comes from three sources:

1. DC intermediate circuit coils.
2. Integral fan.
3. RFI filter choke.

The typical values measured at a distance of 1 m from the unit:

| Frame size | At reduced fan speed <br> $(50 \%)$ <br> [dBA] ${ }^{* * *}$ | Full fan speed [dBA] |
| :--- | :---: | :---: |
| A1 | 51 | 60 |
| A2 | 51 | 60 |
| A3 | 51 | 60 |
| A5 | 54 | 63 |
| B1 | 61 | 67 |

| ** Remaining E1+E2 power sizes. <br> *** For D and E sizes, reduced fan speed is at $87 \%$. |  |  |

### 4.8.1 du/dt Conditions

## NOTE

## 380-690V

To avoid premature ageing of motors (without phase insulation paper or other insulation reinforcement) not designed for frequency converter operation, Danfoss strongly recommend to fit a du/dt filter or a Sine-Wave filter on the output of the frequency converter. For further information about du/dt and Sine-Wave filters see the Output Filters Design Guide - MG.90.NY.XX.

When a transistor in the inverter bridge switches, the voltage across the motor increases by a du/dt ratio depending on:

- the motor cable (type, cross-section, length screened or unscreened)
- inductance

The natural induction causes an overshoot Upeak in the motor voltage before it stabilises itself at a level depending on the voltage in the intermediate circuit. The rise time and the peak voltage UPEAK affect the service life of the motor. If the peak voltage is too high, especially motors without phase coil insulation are affected. If the motor cable is short (a few metres), the rise time and peak voltage are lower.
If the motor cable is long ( 100 m ), the rise time and peak voltage are higher.

Peak voltage on the motor terminals is caused by the switching of the IGBTs. The FC 300 complies with the demands of IEC 60034-25 regarding motors designed to be controlled by frequency converters. The FC 300 also complies with IEC 60034-17 regarding Norm motors controlled by frequency converters

### 4.9 Special Conditions

Under some special conditions, where the operation of the drive is challenged, derating must be taken into account. In some conditions, derating must be done manually. In other conditions, the drive automatically performs a degree of derating when necessary. This is done in order to ensure the performance at critical stages where the alternative could be a trip.

### 4.9.1 Manual Derating

Manual derating must be considered for:

- Air pressure - relevant for installation at altitudes above 1 km
- Motor speed - at continuous operation at low RPM in constant torque applications
- Ambient temperature - relevant for ambient temperatures above $50^{\circ} \mathrm{C}$

See application note MN.33.FX.YY for tables and elaboration. Only the case of running at low motor speeds is elaborated here.

### 4.6.1.1 Derating for Running at Low Speed

When a motor is connected to a frequency converter, it is necessary to check that the cooling of the motor is adequate.
The level of heating depends on the load on the motor, as well as the operating speed and time.

## Constant torque applications (CT mode)

A problem may occur at low RPM values in constant torque applications. In a constant torque application sa motor may over-heat at low speeds due to less cooling air from the motor integral fan.
Therefore, if the motor is to be run continuously at an RPM value lower than half of the rated value, the motor must be supplied with additional air-cooling (or a motor designed for this type of operation may be used).

An alternative is to reduce the load level of the motor by choosing a larger motor. However, the design of the frequency converter puts a limit to the motor size.

## Variable (Quadratic) torque applications (VT)

In VT applications such as centrifugal pumps and fans, where the torque is proportional to the square of the speed and the power is proportional to the cube of the speed, there is no need for additional cooling or de-rating of the motor.

In the graphs shown below, the typical VT curve is below the maximum torque with de-rating and maximum torque with forced cooling at all speeds.

### 4.9.2 Automatic Derating

The drive constantly checks for critical levels:

- Critical high temperature on the control card or heatsink
- High motor load
- High DC link voltage
- Low motor speed

As a response to a critical level, the frequency converter adjusts the switching frequency. For critical high internal temperatures and low motor speed, the drive can also force the PWM pattern to SFAVM.

## NOTE

The automatic derating is different when par. 14-55 Output Filter is set to [2] Sine-Wave Filter Fixed.

How to Order
FC 300 Design Guide

## 5 How to Order

## 5．1．1 Ordering from Type Code

| C1 options | 35 | 目 |
| C option software | 36－37 |  |
| D options | 38－39 | 目 |

Not all choices／options are available for each FC 301／FC 302 variant．To verify if the appropriate version is available， please consult the Drive Configurator on the Internet．

## 5．1．2 Drive Configurator

It is possible to design an FC 300 frequency converter according to the application requirements by using the ordering number system．

For the FC 300 Series，you can order standard drives and drives with integral options by sending a type code string describing the product to the local Danfoss sales office，i．e．：

## FC－302PK75T5E20H1BGCXXXSXXXXAOBXCXXXXD0

The meaning of the characters in the string can be located in the pages containing the ordering numbers in this chapter．In the example above，a Profibus DP V1 and a 24 V back－up option is included in the drive．

From the Internet based Drive Configurator，you can configure the right drive for the right application and generate the type code string．The Drive Configurator will automatically generate an eight－digit sales number to be delivered to your local sales office．
Furthermore，you can establish a project list with several products and send it to a Danfoss sales representative．

The Drive Configurator can be found on the global Internet site：www．danfoss．com／drives．

Drives will automatically be delivered with a language package relevant to the region from which it is ordered．
Four regional language packages cover the following languages：
Language package 1
English，German，French，Danish，Dutch，Spanish，Swedish， Italian and Finnish．
Language package 2
English，German，Chinese，Korean，Japanese，Thai， Traditional Chinese and Bahasa Indonesian．
Language package 3
English，German，Slovenian，Bulgarian，Serbian，Romanian， Hungarian，Czech and Russian．
Language package 4
English，German，Spanish，English US，Greek，Brazilian Portuguese，Turkish and Polish．

To order drives with a different language package, please contact your local sales office.

## Abbreviations for the Tables

${ }^{*}$ ) Resulting max. brake torque when using Rrec. Using the Rbr,nom will result in maximum brake torque e.g. $160 \%$. The value in brackets is the drives max. brake torque
${ }^{2 *}$ ) All cabling must comply with national and local regulations on cable cross-sections and ambient temperature. Copper $\left(60 / 75^{\circ} \mathrm{C}\right)$ conductors are recommended.
${ }^{3 *}$ ) Order the specified amount of Brake Resistors (e.g. $2 \times 1062=2$ pieces of 175U1062). See table header for the first four characters (175U or 130B).
${ }^{4 *}$ ) Rating for each thermistor relay (using one thermistor relay per resistor).
${ }^{5 *}$ ) Parallel star connection (see the Installation chapter).
${ }^{6 *}$ ) Please contact Danfoss for further info.
${ }^{7 *}$ ) With Klixon Switch

| $\mathrm{P}_{\mathrm{m}}$ | : Rated motor size for VLT type |
| :--- | :--- |
| $\mathrm{R}_{\min }$ | $:$ Minimum permissible brake resistor - by drive |
| $\mathrm{R}_{\text {rec }}$ | : Recommended brake resistor (Danfoss) |
| $\mathrm{P}_{\mathrm{b}, \text { max }}$ | $:$ Brake resistor rated power as stated by supplier |
| Therm. relay | : Brake current setting of thermal relay |
| Code number | : Order numbers for Danfoss Brake Resistors |
| Cable cross section | : Recommended minimum value based upon PVC insulated copper cable, 30 degree Celsius ambient temperature |
| with normal heat dissipation |  |

# 6 Mechanical Installation - Frame Size A, B and C 

### 6.1.1 Safety Requirements of Mechanical Installation

## AWARNING

Pay attention to the requirements that apply to integration and field mounting kit. Observe the information in the list to avoid serious injury or equipment damage, especially when installing large units.

## CAUTION

The frequency converter is cooled by means of air circulation.
To protect the unit from overheating, it must be ensured that the ambient temperature does not exceed the maximum temperature stated for the frequency converter and that the 24 -hour average temperature is not exceeded. Locate the maximum temperature and 24 -hour average in the paragraph Derating for Ambient Temperature. If the ambient temperature is in the range of $45^{\circ} \mathrm{C}-55^{\circ}$ C , derating of the frequency converter will become relevant, see Derating for Ambient Temperature.
The service life of the frequency converter is reduced if derating for ambient temperature is not taken into account.

FC 300 Design Guide

Mechanical Installation - F...

Mechanical Installation - F...
FC 300 Design Guide

### 6.1.2 Mechanical Mounting

All Frame Sizes allow side-by-side installation except when a IP21/IP4X/ TYPE 1 Enclosure Kit is used (see the Options and Accessories section of the Design Guide).

If the IP 21 Enclosure kit is used on frame size A1, A2 or A3, there must be a clearance between the drives of min. 50 mm .

For optimal cooling conditions allow a free air passage above and below the frequency converter. See table below.

* FC 301 only

1. Drill holes in accordance with the measurements given.
2. You must provide screws suitable for the surface on which you want to mount the frequency converter. Retighten all four screws.

Mounting frame sizes A4, A5, B1, B2, C1, and C2 on a nonsolid back wall, the drive must be provided with a back plate, "A", due to insufficient cooling air over the heat sink.

|  | Tightening torque for covers (Nm) |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Frame | IP20 | IP21 | IP55 |
| A1 | $*$ | - | IP66 |  |
| A2 | $*$ | $*$ | - | - |

| A4/A5 | - | - | 2 | - |
| B1 | - | $*$ | 2,2 | 2 |
| B2 | - | $*$ | 2,2 | 2,2 |
| B3 | $*$ | - | - | - |
| B4 | 2 | - | - | - |
| C1 | - | $*$ | 2,2 | 2,2 |
| C2 | - | $*$ | 2,2 | 2,2 |
| C3 | 2 | - | - | - |
| C4 | 2 | - | - | - |
| $*=$ No screws to tighten |  |  |  |  |
| $-=$ Does not exist |  |  |  |  |

### 6.1.3 Field Mounting

For field mounting the IP 21/IP 4X top/TYPE 1 kits or IP 54/55 units are recommended.

## 7 Mechanical Installation - Frame size D, E and F

### 7.1 Pre-installation

### 7.1.1 Planning the Installation Site

## CAUTION

Before performing the installation it is important to plan the installation of the frequency converter. Neglecting this may result in extra work during and after installation.

Select the best possible operation site by considering the following (see details on the following pages, and the respective Design Guides):

- Ambient operating temperature
- Installation method
- How to cool the unit
- Position of the frequency converter
- Cable routing
- Ensure the power source supplies the correct voltage and necessary current
- Ensure that the motor current rating is within the maximum current from the frequency converter
- If the frequency converter is without built-in fuses, ensure that the external fuses are rated correctly.

### 7.1.2 Receiving the Frequency Converter

When receiving the frequency converter please make sure that the packaging is intact, and be aware of any damage that might have occurred to the unit during transport. In case damage has occurred, contact immediately the shipping company to claim the damage.

### 7.1.3 Transportation and Unpacking

Before unpacking the frequency converter it is recommended that it is located as close as possible to the final installation site.
Remove the box and handle the frequency converter on the pallet, as long as possible.

### 7.1.4 Lifting

Always lift the frequency converter in the dedicated lifting eyes. For all D and E2 (IPOO) enclosures, use a bar to avoid bending the lifting holes of the frequency converter.

Illustration 7.1 Recommended Lifting Method, Frame Sizes D and E.

## $\triangle$ WARNING

The lifting bar must be able to handle the weight of the frequency converter. See Mechanical Dimensions for the weight of the different frame sizes. Maximum diameter for bar is 2.5 cm ( 1 inch ). The angle from the top of the drive to the lifting cable should be $60^{\circ} \mathrm{C}$ or greater.

Illustration 7.2 Recommended Lifting Method, Frame Sizes F1, F2, F9 and F10

Illustration 7.3 Recommended Lifting Method, Frame Sizes F3, F4, F11, F12 and F13

Illustration 7.4 Recommended Lifting Method, Frame Sizes F8

## NOTE

The plinth is provided in the same packaging as the frequency converter but is not attached to frame sizes F1F4 during shipment. The plinth is required to allow airflow to the drive to provide proper cooling. The F frames should be positioned on top of the plinth in the final installation location. The angle from the top of the drive to the lifting cable should be $60^{\circ} \mathrm{C}$ or greater.
In addition to the drawings above a spreader bar is an acceptable way to lift the F Frame.

### 7.1.5 Mechanical Dimensions

Mechanical Installation - ...
FC 300 Design Guide

| Mechanical dimensions, frame size D |  |  |  |  |  |  |  |

### 7.1.6 Mechanical Dimensions, 12-Pulse Units

### 7.2 Mechanical Installation

Preparation of the mechanical installation of the frequency converter must be done carefully to ensure a proper result and to avoid additional work during installation. Start taking a close look at the mechanical drawings at the end of this instruction to become familiar with the space demands.

### 7.2.1 Tools Needed

To perform the mechanical installation the following tools are needed:

- Drill with 10 or 12 mm drill
- Tape measure
- Wrench with relevant metric sockets (7-17 mm)
- Extensions to wrench
- $\quad$ Sheet metal punch for conduits or cable glands in IP 21/Nema 1 and IP 54 units
- Lifting bar to lift the unit (rod or tube max. $\varnothing 25$ mm ( 1 inch ), able to lift minimum 400 kg ( 880 $\mathrm{lbs})$ ).
- Crane or other lifting aid to place the frequency converter in position
- A Torx T50 tool is needed to install the E1 in IP21 and IP54 enclosure types.

### 7.2.2 General Considerations

## Wire access

Ensure that proper cable access is present including necessary bending allowance. As the IP00 enclosure is open to the bottom cables must be fixed to the back panel of the enclosure where the frequency converter is mounted, i.e. by using cable clamps.

## CAUTION

All cable lugs/ shoes must mount within the width of the terminal bus bar.

## Space

Ensure proper space above and below the frequency converter to allow airflow and cable access. In addition space in front of the unit must be considered to enable opening of the door of the panel.

Illustration 7.5 Space in front of IP21/IP54 enclosure type, frame size D1 and D2 .

### 7.2.3 Terminal Locations - Frame size $D$

Take the following position of the terminals into consideration when you design for cables access.

(0,)

Illustration 7.17 Position of power connections, frame size D3 and D4

Illustration 7.18 Position of power connections with disconnect switch, frame size D1 and D2

Mechanical Installation - ...
FC 300 Design Guide

Be aware that the power cables are heavy and hard to bend. Consider the optimum position of the frequency converter for ensuring easy installation of the cables.

## NOTE

All D frames are available with standard input terminals or disconnect switch. All terminal dimensions can be found in the following table.

|  | IP21 (NEMA 1) / IP54 <br> (NEMA 12) |  | IP00 / Chassis |  |
| :--- | :--- | :--- | :--- | :--- |
|  | Frame size <br> D1 | Frame size <br> D2 | Frame size <br> D3 | Frame size <br> D4 |
| A | $277(10.9)$ | $379(14.9)$ | $119(4.7)$ | $122(4.8)$ |

### 7.2.7 Cooling and Airflow

## Cooling

Cooling can be obtained in different ways, by using the cooling ducts in the bottom and the top of the unit, by taking air in and out the back of the unit or by combining the cooling possibilities.

## Duct cooling

A dedicated option has been developed to optimize installation of IP00/chassis frequency converters in Rittal TS8 enclosures utilizing the fan of the frequency converter for forced air cooling of the backchannel. The air out the top of the enclosure could but ducted outside a facility so the heat loses from the backchannel are not dissipated within the control room reducing air-conditioning requirements of the facility.
Please see Installation of Duct Cooling Kit in Rittal enclosures, for further information.

## Back cooling

The backchannel air can also be ventilated in and out the back of a Rittal TS8 enclosure. This offers a solution where the backchannel could take air from outside the facility

| Enclosure protection | Frame size | Door fan(s) / Top fan airflow | Heatsink fan(s) |
| :---: | :---: | :---: | :---: |
| IP21 / NEMA 1 <br> IP54 / NEMA 12 | D1 and D2 | $170 \mathrm{~m}^{3} / \mathrm{h}$ (100 cfm) | $765 \mathrm{~m}^{3} / \mathrm{h}$ (450 cfm) |
|  | E1 P250T5, P355T7, P400T7 | $340 \mathrm{~m}^{3} / \mathrm{h}(200 \mathrm{cfm})$ | $1105 \mathrm{~m}^{3} / \mathrm{h}(650 \mathrm{cfm})$ |
|  | E1P315-P400T5, P500-P560T7 | $340 \mathrm{~m}^{3} / \mathrm{h}(200 \mathrm{cfm})$ | $1445 \mathrm{~m}^{3} / \mathrm{h}$ (850 cfm) |
| IP21 / NEMA 1 | F1, F2, F3 and F4 | $700 \mathrm{~m}^{3} / \mathrm{h}(412 \mathrm{cfm})^{*}$ | $985 \mathrm{~m}^{3} / \mathrm{h}(580 \mathrm{cfm})^{*}$ |
| IP54 / NEMA 12 | F1, F2, F3 and F4 | $525 \mathrm{~m}^{3} / \mathrm{h}(309 \mathrm{cfm})^{*}$ | $985 \mathrm{~m}^{3} / \mathrm{h}(580 \mathrm{cfm})^{*}$ |
| IP00 / Chassis | D3 and D4 | $255 \mathrm{~m}^{3} / \mathrm{h}$ (150 cfm) | $765 \mathrm{~m}^{3} / \mathrm{h}(450 \mathrm{cfm})$ |
|  | E2 P250T5, P355T7, P400T7 | $255 \mathrm{~m}^{3} / \mathrm{h}$ (150 cfm) | $1105 \mathrm{~m}^{3} / \mathrm{h}(650 \mathrm{cfm})$ |
|  | E2 P315-P400T5, P500-P560T7 | $255 \mathrm{~m}^{3} / \mathrm{h}(150 \mathrm{cfm})$ | $1445 \mathrm{~m}^{3} / \mathrm{h}$ (850 cfm) |

Table 7.3 Heatsink Air Flow

## NOTE

The fan runs for the following reasons:

1. AMA
2. DC Hold
3. Pre-Mag
4. DC Brake
5. $60 \%$ of nominal current is exceeded
6. Specific heatsink temperature exceeded (power size dependent).
7. Specific Power Card ambient temperature exceeded (power size dependent)
8. Specific Control Card ambient temperature exceeded

Once the fan is started it will run for minimum 10 minutes.

## External ducts

If additional duct work is added externally to the Rittal cabinet the pressure drop in the ducting must be calculated. Use the charts below to derate the frequency converter according to the pressure drop.

Illustration 7.39 D frame Derating vs. Pressure Change Drive air flow: $450 \mathrm{cfm}\left(765 \mathrm{~m}^{3} / \mathrm{h}\right)$

Illustration 7.40 E frame Derating vs. Pressure Change (Small Fan), P250T5 and P355T7-P400T7
Drive air flow: 650 cfm ( $1105 \mathrm{~m}^{3} / \mathrm{h}$ )

Illustration 7.41 E frame Derating vs. Pressure Change (Large Fan), P315T5-P400T5 and P500T7-P560T7
Drive air flow: 850 cfm ( $1445 \mathrm{~m}^{3} / \mathrm{h}$ )

Illustration 7.42 F1, F2, F3, F4 frame Derating vs. Pressure
Change
Drive air flow: $580 \mathrm{cfm}\left(985 \mathrm{~m}^{3} / \mathrm{h}\right)$

### 7.2.8 Installation on the Wall - IP21 (NEMA 1) and IP54 (NEMA 12) Units

This only applies to frame sizes D1 and D2. It must be considered where to install the unit.

Take the relevant points into consideration before you select the final installation site:

- Free space for cooling
- Access to open the door
- Cable entry from the bottom

Mark the mounting holes carefully using the mounting template on the wall and drill the holes as indicated. Ensure proper distance to the floor and the ceiling for cooling. A minimum of 225 mm ( 8.9 inch) below the frequency converter is needed. Mount the bolts at the bottom and lift the frequency converter up on the bolts. Tilt the frequency converter against the wall and mount the upper bolts. Tighten all four bolts to secure the frequency converter against the wall.

Illustration 7.43 Lifting method for mounting drive on wall

### 7.2.9 Gland/Conduit Entry - IP21 (NEMA 1) and IP54 (NEMA12)

Cables are connected through the gland plate from the bottom. Remove the plate and plan where to place the entry for the glands or conduits. Prepare holes in the marked area on the drawing.

## NOTE

The gland plate must be fitted to the frequency converter to ensure the specified protection degree, as well as ensuring proper cooling of the unit. If the gland plate is not mounted, the frequency converter may trip on Alarm 69, Pwr. Card Temp

Cable entries viewed from the bottom of the frequency converter - 1) Mains side 2) Motor side

Illustration 7.44 Example of Proper Installation of Gland Plate.

Illustration 7.45 Frame Sizes D1 + D2

Illustration 7.46 Frame Size E1

F1-F4: Cable entries viewed from the bottom of the frequency converter-1) Place conduits in marked areas

Illustration 7.47 Frame Size F1

Illustration 7.48 Frame Size F2

Illustration 7.50 Frame Size F4

### 7.2.10 Gland/Conduit Entry, 12-Pulse - IP21 (NEMA 1) and IP54 (NEMA12)

Frame size F8

Mechanical Installation - ...
FC 300 Design Guide

Illustration 7.51 Mounting of bottom plate,frame size E1.

The bottom plate of the E1 can be mounted from either in- or outside of the enclosure, allowing flexibility in the installation process, i.e. if mounted from the bottom the glands and cables can be mounted before the frequency converter is placed on the pedestal.

### 7.2.11 IP21 Drip Shield Installation (Frame size D1 and D2 )

To comply with the IP21 rating, a separate drip shield is to be installed as explained below:

- Remove the two front screws
- Insert the drip shield and replace screws
- Torque the screws to $5,6 \mathrm{Nm}$ ( 50 in -lbs)

Illustration 7.52 Drip shield installation.

## 8 Electrical Installation

### 8.1 Connections- Frame Sizes A, B and C

## NOTE

Cables General
All cabling must comply with national and local regulations on cable cross-sections and ambient temperature. Copper $\left(75^{\circ} \mathrm{C}\right)$ conductors are recommended.

Terminals can accept aluminium conductors but the conductor surface has to be clean and the oxidation must be removed and sealed by neutral acid-free Vaseline grease before the conductor is connected.
Furthermore the terminal screw must be retightened after two days due to softness of the aluminium. It is crucial to keep the connection a gas tight joint, otherwise the aluminium surface will oxidize again.

## Aluminium Conductors

| Tightening-up Torque |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Frame size | 200-240 V | $380-500 \mathrm{~V}$ | $525-690 \mathrm{~V}$ | Cable for: | Tightening up torque |
| A1 | $0.25-1.5 \mathrm{~kW}$ | $0.37-1.5 \mathrm{~kW}$ | - | Mains, Brake resistor, load sharing, Motor cables | 0.5-0.6 Nm |
| A2 | $0.25-2.2 \mathrm{~kW}$ | $0.37-4 \mathrm{~kW}$ | - |  |  |
| A3 | 3-3.7 kW | $5.5-7.5 \mathrm{~kW}$ | - |  |  |
| A4 | 0.25-2-2 kW | $0.37-4 \mathrm{~kW}$ |  |  |  |
| A5 | 3-3.7 kW | $5.5-7.5 \mathrm{~kW}$ | - |  |  |
| B1 | 5.5-7.5 kW | 11-15 kW | - | Mains, Brake resistor, load sharing, Motor cables | 1.8 Nm |

|  |  |  |  | Relay | 0.5-0.6 Nm |
|  |  |  |  | Earth | 2-3 Nm |
| C4 | 37-45 kW | 55-75 kW | - | Mains, motor cables | 14 Nm (up to $95 \mathrm{~mm}^{2}$ ) 24 Nm (over $95 \mathrm{~mm}^{2}$ ) |
|  |  |  |  | Load Sharing, brake cables | 14 Nm |
|  |  |  |  | Relay | 0.5-0.6 Nm |
|  |  |  |  | Earth | 2-3 Nm |

### 8.1.1 Removal of Knockouts for Extra Cables

1. Remove cable entry from the frequency converter (Avoiding foreign parts falling into the frequency converter when removing knockouts)
2. Cable entry has to be supported around the knockout you intend to remove.
3. The knockout can now be removed with a strong mandrel and a hammer.
4. Remove burrs from the hole.
5. Mount Cable entry on frequency converter.

### 8.1.2 Connection to Mains and Earthing

## NOTE

The plug connector for power is plugable on frequency converters up to 7.5 kW .

1. Fit the two screws in the de-coupling plate, slide it into place and tighten the screws.
2. Make sure the frequency converter is properly earthed. Connect to earth connection (terminal 95). Use screw from the accessory bag.
3. Place plug connector 91(L1), 92(L2), 93(L3) from the accessory bag onto the terminals labelled MAINS at the bottom of the frequency converter.
4. Attach mains wires to the mains plug connector.
5. Support the cable with the supporting enclosed brackets.

## NOTE

Check that mains voltage corresponds to the mains voltage of the name plate.

## ACAUTION

IT Mains
Do not connect 400V frequency converters with RFI-filters to mains supplies with a voltage between phase and earth of more than 440 V .

## ACAUTION

The earth connection cable cross section must be at least $10 \mathrm{~mm}^{2}$ or 2 x rated mains wires terminated separately according to EN 50178.

The mains connection is fitted to the mains switch if this is included.

Mains connector frame size A4/A5 (IP 55/66)

When disconnector is used (frame size A4/A5) the PE must be mounted on the left side of the drive.

Illustration 8.1 Mains connection frame sizes B1 and B2 (IP 21/ NEMA Type 1 and IP 55/66/ NEMA Type 12).

Illustration 8.2 Mains connection size B3 (IP20).

## Illustration 8.3 Mains connection size B4 (IP20).

Illustration 8.4 Mains connection size C1 and C2 (IP 21/ NEMA Type 1 and IP 55/66/ NEMA Type 12).

Illustration 8.5 Mains connection size C3 (IP20).

Illustration 8.6 Mains connection size C4 (IP20).

Usually the power cables for mains are unscreened cables.

### 8.1.3 Motor Connection

To comply with EMC emission specifications, screened/ armoured cables are recommended. For more information, see 3.4.2 EMC Test Results.

See section General Specifications for correct dimensioning of motor cable cross-section and length.

Screening of cables: Avoid installation with twisted screen ends (pigtails). They spoil the screening effect at higher frequencies. If it is necessary to break the screen to install a motor isolator or motor contactor, the screen must be continued at the lowest possible HF impedance.
Connect the motor cable screen to both the decoupling plate of the frequency converter and to the metal housing of the motor.
Make the screen connections with the largest possible surface area (cable clamp). This is done by using the supplied installation devices in the frequency converter. If it is necessary to split the screen to install a motor isolator or motor relay, the screen must be continued with the lowest possible HF impedance.

Cable-length and cross-section: The frequency converter has been tested with a given length of cable and a given cross-section of that cable. If the cross-section is increased, the cable capacitance - and thus the leakage current - may increase, and the cable length must be reduced correspondingly. Keep the motor cable as short as possible to reduce the noise level and leakage currents.

Switching frequency: When frequency converters are used together with Sine-wave filters to reduce the acoustic noise from a motor, the switching frequency must be set according to the Sine-wave filter instruction in 14-01 Switching Frequency.

1. Fasten decoupling plate to the bottom of the frequency converter with screws and washers from the accessory bag.
2. Attach motor cable to terminals 96 (U), 97 (V), 98 (W).
3. Connect to earth connection (terminal 99) on decoupling plate with screws from the accessory bag.
4. Insert plug connectors 96 (U), 97 (V), 98 (W) (up to 7.5 kW ) and motor cable to terminals labelled MOTOR.
5. Fasten screened cable to decoupling plate with screws and washers from the accessory bag.

All types of three-phase asynchronous standard motors can be connected to the frequency converter. Normally, small motors are star-connected (230/400 V, Y). Large motors are normally delta-connected ( $400 / 690 \mathrm{~V}, \Delta$ ). Refer to the motor name plate for correct connection mode and voltage.

| Term. no. | 96 | 97 | 98 | 99 |  |  |
| :--- | :---: | :---: | :---: | :---: | :--- | :--- |
|  | U | V | W | $\mathrm{PE}^{1)}$ |  | Motor voltage 0-100\% of mains voltage. <br> 3 |
|  |  |  |  |  |  | wires out of motor |, | Delta-connected |
| :--- |

${ }^{1)}$ Protected Earth Connection

|  |  |  | U | V | W | 은 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| U | O | W |  |  | $Q$ |  |
|  | $?$ | $?$ |  |  |  |  |
| 96 | 97 | 98 | 96 | 97 | 98 |  |
|  |  |  |  | $\Lambda$ |  |  |

In motors without phase insulation paper or other insulation reinforcement suitable for operation with voltage supply (such as a frequency converter), fit a Sinewave filter on the output of the frequency converter.

## Cable entry holes

The suggested use of the holes are purely recommendations and other solutions are possible. Unused cable entry holes can be sealed with rubber grommets (for IP 21).

### 8.1.4 Relay Connection

To set relay output, see parameter group 5-4* Relays.

| No. | $01-02$ | make (normally open) |
| :--- | :--- | :--- |
|  | $01-03$ | break (normally closed) |
|  | $04-05$ | make (normally open) |
|  | $04-06$ | break (normally closed) |

### 8.2 Connections - Frame Sizes D, E and F

### 8.2.1 Torque

When tightening all electrical connections it is very important to tighten with the correct torque. Too low or too high torque results in a bad electrical connection. Use a torque wrench to ensure correct torque

Illustration 8.29 Always use a torque wrench to tighten the bolts.

| Frame size | Terminal | Torque | Bolt size |

Table 8.1 Torque for terminals

### 8.2.2 Power Connections

## Cabling and Fusing

## NOTE

Cables General
All cabling must comply with national and local regulations on cable cross-sections and ambient temperature. UL applications require $75{ }^{\circ} \mathrm{C}$ copper conductors. 75 and $90^{\circ} \mathrm{C}$ copper conductors are thermally acceptable for the frequency converter to use in non UL applications.

The power cable connections are situated as shown below. Dimensioning of cable cross section must be done in accordance with the current ratings and local legislation. See the Specifications section for details.

For protection of the frequency converter, the recommended fuses must be used or the unit must be with built-in fuses. Recommended fuses can be seen in the tables of the fuse section. Always ensure that proper fusing is made according to local regulation.

The mains connection is fitted to the mains switch if this is included.

## NOTE

The motor cable must be screened/armoured. If an unscreened/unarmoured cable is used, some EMC requirements are not complied with. Use a screened/ armoured motor cable to comply with EMC emission specifications. For more information, see EMC specifications in the Design Guide.

See section General Specifications for correct dimensioning of motor cable cross-section and length.

## Screening of cables:

Avoid installation with twisted screen ends (pigtails). They spoil the screening effect at higher frequencies. If it is necessary to break the screen to install a motor isolator or motor contactor, the screen must be continued at the lowest possible HF impedance.

Connect the motor cable screen to both the de-coupling plate of the frequency converter and to the metal housing of the motor.

Electrical Installation
FC 300 Design Guide

Make the screen connections with the largest possible surface area (cable clamp). This is done by using the supplied installation devices within the frequency converter.
Cable-length and cross-section:
The frequency converter has been EMC tested with a given length of cable. Keep the motor cable as short as possible to reduce the noise level and leakage currents.

## Switching frequency:

When frequency converters are used together with Sinewave filters to reduce the acoustic noise from a motor, the switching frequency must be set according to the instruction in 14-01 Switching Frequency.

${ }^{11}$ Protected Earth Connection

## CAUTION

In motors without phase insulation paper or other insulation reinforcement suitable for operation with voltage supply (such as a frequency converter), fit a Sinewave filter on the output of the frequency converter.

### 8.2.3 Power Connections 12-Pulse Drives

Cabling and Fusing

## NOTE

Cables General
All cabling must comply with national and local regulations on cable cross-sections and ambient temperature. UL applications require $75^{\circ} \mathrm{C}$ copper conductors. 75 and $90^{\circ} \mathrm{C}$ copper conductors are thermally acceptable for the frequency converter to use in non UL applications.

The power cable connections are situated as shown below. Dimensioning of cable cross section must be done in accordance with the current ratings and local legislation. See for details.

For protection of the frequency converter, the recommended fuses must be used or the unit must be with built-in fuses. Recommended fuses can be seen in the tables of the fuse section. Always ensure that proper fusing is made according to local regulation.

The mains connection is fitted to the mains switch if this is included.

## NOTE

The motor cable must be screened/armoured. If an unscreened/unarmoured cable is used, some EMC requirements are not complied with. Use a screened/ armoured motor cable to comply with EMC emission specifications. For more information, see EMC specifications in the Design Guide.

See for correct dimensioning of motor cable cross-section and length.

## Illustration 8.43

A) 6-Pulse Connection ${ }^{11,2), ~ 3)}$
B) Modified 6-Pulse Connection ${ }^{2), ~ 3), ~ 4) ~}$
C) 12-Pulse Connection ${ }^{3), 5)}$

## Notes:

1) Parallel connection shown. A single three phase cable may be used with sufficient carrying capability. Shorting busbars must be installed.
2) 6-pulse connection eliminates the harmonics reduction benefits of the 12 -pulse rectifier.
3) Suitable for IT and TN mains connection.
4) In the unlikely event that one of the 6-pulse modular rectifiers becomes inoperable, it is possible to operate the drive at reduced load with a single 6-pulse rectifier. Contact factory for reconnection details.
5) No paralleling of mains cabling is shown here.

Electrical Installation
FC 300 Design Guide

## Screening of cables:

Avoid installation with twisted screen ends (pigtails). They spoil the screening effect at higher frequencies. If it is necessary to break the screen to install a motor isolator or motor contactor, the screen must be continued at the lowest possible HF impedance.

Connect the motor cable screen to both the de-coupling plate of the frequency converter and to the metal housing of the motor.

Make the screen connections with the largest possible surface area (cable clamp). This is done by using the
supplied installation devices within the frequency converter.

## Cable-length and cross-section:

The frequency converter has been EMC tested with a given length of cable. Keep the motor cable as short as possible to reduce the noise level and leakage currents.

## Switching frequency:

When frequency converters are used together with Sinewave filters to reduce the acoustic noise from a motor, the switching frequency must be set according to the instruction in 14-01 Switching Frequency.

| Term. no. | 96 | 97 | 98 | 99 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | U | V | W | PE ${ }^{1)}$ | Motor voltage 0-100\% of mains voltage. <br> 3 wires out of motor |

### 8.2.4 Shielding against Electrical Noise

Before mounting the mains power cable, mount the EMC metal cover to ensure best EMC performance.

NOTE: The EMC metal cover is only included in units with an RFI filter.

Illustration 8.50 Mounting of EMC shield.

### 8.2.5 External Fan Supply

## Frame size D,E,F

In case the frequency converter is supplied by $D C$ or if the fan must run independently of the power supply, an external power supply can be applied. The connection is made on the power card.

| Terminal No. | Function |
| :--- | :--- |
| 100,101 | Auxiliary supply S, T |
| 102,103 | Internal supply S, T |

The connector located on the power card provides the connection of line voltage for the cooling fans. The fans are connected from factory to be supplied form a common AC line (jumpers between 100-102 and 101-103). If external supply is needed, the jumpers are removed and the supply is connected to terminals 100 and 101. A 5 Amp fuse should be used for protection. In UL applications this should be LittleFuse KLK-5 or equivalent.

### 8.3 Fuses and Circuit Breakers

It is recommended to use fuses and/ or Circuit Breakers on the supply side as protection in case of component breakdown inside the frequency converter (first fault).

## NOTE

This is mandatory in order to ensure compliance with IEC 60364 for CE or NEC 2009 for UL.

## AWARNING

Personnel and property must be protected against the consequence of component break-down internally in the frequency converter.

## Branch Circuit Protection

In order to protect the installation against electrical and fire hazard, all branch circuits in an installation, switch gear, machines etc., must be protected against short-circuit and over-current according to national/international regulations.

## NOTE

The recommendations given do not cover Branch circuit protection for UL.

## Short-circuit protection:

Danfoss recommends using the fuses/Circuit Breakers mentioned below to protect service personnel and property in case of component break-down in the frequency converter.

### 8.3.1 Recommendations

## $\triangle$ WARNING

In case of malfunction, not following the recommendation may result in personnel risk and damage to the frequency converter and other equipment.

The following tables list the recommended rated current. Recommended fuses are of the type gG for small to medium power sizes. For larger powers, aR fuses are recommended. For Circuit Breakers, Moeller types have been tested to have a recommendation. Other types of circuit breakers may be used provide they limit the energy into the frequency converter to a level equal to or lower than the Moeller types.

If fuses/Circuit Breakers according to recommendations are chosen, possible damages on the frequency converter will mainly be limited to damages inside the unit.

For further information please see Application Note Fuses and Circuit Breakers, MN.90.TX.YY

### 8.3.2 CE Compliance

Fuses or Circuit Breakers are mandatory to comply with IEC 60364. Danfoss recommend using a selection of the following.

The fuses below are suitable for use on a circuit capable of delivering 100,000 Arms (symmetrical), 240 V , or 480 V , or 500 V , or 600 V depending on the frequency converter voltage rating. With the proper fusing the frequency converter short circuit current rating (SCCR) is 100,000 Arms.

Table 8.5 525-690V, Frame Sizes B, C, D, E, and F

## UL Compliance

Fuses or Circuit Breakers are mandatory to comply with NEC 2009. We recommend using a selection of the following
The fuses below are suitable for use on a circuit capable of delivering 100,000 Arms (symmetrical), 240V, or 480V, or 500V, or 600 V depending on the frequency converter voltage rating. With the proper fusing the drive Short Circuit Current Rating (SCCR) is 100,000 Arms.

## Table 8.29 Safety Relay Coil Fuse with PILZ Relay

The fuses below are suitable for use on a circuit capable of delivering 100,000 Arms (symmetrical), 240 V , or 480 V , or 500 V , or 600 V depending on the drive voltage rating. With
the proper fusing the drive Short Circuit Current Rating (SCCR) is 100,000 Arms.

| F4 | P710-P800 380-500V \& P1M2 525-690V | Eaton XTCEC14P22B |

## AWARNING

Customer supplied 230V supply required for Mains

## Contactors.

### 8.5 Additional Motor Information

### 8.5.1 Motor Cable

The motor must be connected to terminals U/T1/96, V/ T2/97, W/T3/98. Earth to terminal 99. All types of threephase asynchronous standard motors can be used with a frequency converter unit. The factory setting is for clockwise rotation with the frequency converter output connected as follows:

| Terminal No. | Function |
| :--- | :--- |
| $96,97,98,99$ | Mains U/T1, V/T2, W/T3 <br> Earth |

The direction of rotation can be changed by switching two phases in the motor cable or by changing the setting of 4-10 Motor Speed Direction.

Motor rotation check can be performed using 1-28 Motor Rotation Check and following the steps shown in the display.

## F frame Requirements

F1/F3 requirements: Motor phase cable quantities must be multiples of 2 , resulting in $2,4,6$, or 8 ( 1 cable is not allowed) to obtain equal amount of wires attached to both inverter module terminals. The cables are required to be equal length within $10 \%$ between the inverter module terminals and the first common point of a phase. The recommended common point is the motor terminals.

F2/F4 requirements: Motor phase cable quantities must be multiples of 3 , resulting in $3,6,9$, or 12 ( 1 or 2 cables are not allowed) to obtain equal amount of wires attached to each inverter module terminal. The wires are required to be equal length within $10 \%$ between the inverter module terminals and the first common point of a phase. The recommended common point is the motor terminals.

Output junction box requirements: The length, minimum 2.5 meters, and quantity of cables must be equal from each inverter module to the common terminal in the junction box.

## NOTE

If a retrofit applications requires unequal amount of wires per phase please consult the factory for requirements and documentation or use the top/bottom entry side cabinet option.

### 8.5.2 Motor Thermal Protection

The electronic thermal relay in the frequency converter has received UL-approval for single motor protection, when 1-90 Motor Thermal Protectionis set for ETR Trip and 1-24 Motor Current is set to the rated motor current (see motor name plate).
For thermal motor protection it is also possible to use the MCB 112 PTC Thermistor Card option. This card provides ATEX certificate to protect motors in explosion hazardous areas, Zone $1 / 21$ and Zone 2/22. When 1-90 Motor Thermal Protection is set to [20] ATEX ETR is combined with the use of MCB 112, it is possible to control an Ex-e motor in explosion hazardous areas. Consult the programming guide for details on how to set up the drive for safe operation of Ex-e motors.

### 8.5.3 Parallel Connection of Motors

The frequency converter can control several parallelconnected motors. When using parallel motor connection following must be observed:

- Recommended to run applications with parallel motors in U/F mode par. 1-01 [0]. Set the U/F graph in par. 1-55 and 1-56.
- $\quad \mathrm{VCC}^{+}$mode may be used in some applications.
- The total current consumption of the motors must not exceed the rated output current linv for the frequency converter.
- If motor sizes are widely different in winding resistance, starting problems may arise due to too low motor voltage at low speed.
- The electronic thermal relay (ETR) of the frequency inverter cannot be used as motor protection for the individual motor. Provide further motor protection by e.g. thermistors in each motor winding or individual thermal relays. (Circuit breakers are not suitable as protection device).

Installations with cables connected in a common joint as shown in the first example in the picture is only recommended for short cable lengths.

When motors are connected in parallel, 1-02 Flux Motor Feedback Source cannot be used, and 1-01 Motor Control Principle must be set to Special motor characteristics (U/f).

b) Be aware of the maximum motor cable length specified in Table 8.42.
c, f) The total motor cable length specified in section 4.5, General Specifications, is valid as long as the parallel cables are kept short (less than 10 m each).
d, e) Consider voltage drop across the motor cables.

| Frame Size | Power Size [kW] | Voltage [V] | 1 cable [m] | 2 cables [m] | 3 cables [m] | 4 cables [m] |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A1, A2, A5 | 0.37-0.75 | 400 | 150 | 45 | 8 | 6 |
|  |  | 500 | 150 | 7 | 4 | 3 |
| A2, A5 | 1.1-1.5 | 400 | 150 | 45 | 20 | 8 |
|  |  | 500 | 150 | 45 | 5 | 4 |
| A2, A5 | 2.2-4 | 400 | 150 | 45 | 20 | 11 |
|  |  | 500 | 150 | 45 | 20 | 6 |
| A3, A5 | 5.5-7.5 | 400 | 150 | 45 | 20 | 11 |
|  |  | 500 | 150 | 45 | 20 | 11 |
| B1, B2, B3, B4, | 11-75 | 400 | 150 | 75 | 50 | 37 |
| C1, C2, C3, C4 |  | 500 | 150 | 75 | 50 | 37 |

Problems may arise at start and at low RPM values if motor sizes are widely different because small motors' relatively high ohmic resistance in the stator calls for a higher voltage at start and at low RPM values.

The electronic thermal relay (ETR) of the frequency converter cannot be used as motor protection for the individual motor of systems with parallel-connected motors. Provide further motor protection by e.g. thermistors in each motor or individual thermal relays. (Circuit breakers are not suitable as protection).

### 8.5.4 Motor Insulation

For motor cable lengths $\leq$ the maximum cable length listed in the General Specifications tables the following motor insulation ratings are recommended because the peak voltage can be up to twice the DC link voltage, 2.8 times the mains voltage, due to transmission line effects in the motor cable. If a motor has lower insulation rating it recommended to use a du/dt or sine wave filter.

| Nominal Mains Voltage | Motor Insulation |
| :--- | :--- |
| $\mathrm{U}_{\mathrm{N}} \leq 420 \mathrm{~V}$ | Standard $\mathrm{U}_{\mathrm{LL}}=1300 \mathrm{~V}$ |
| $420 \mathrm{~V}<\mathrm{U}_{\mathrm{N}} \leq 500 \mathrm{~V}$ | Reinforced $\mathrm{U}_{\mathrm{LL}}=1600 \mathrm{~V}$ |
| $500 \mathrm{~V}<\mathrm{U}_{\mathrm{N}} \leq 600 \mathrm{~V}$ | Reinforced $\mathrm{U}_{\mathrm{LL}}=1800 \mathrm{~V}$ |
| $600 \mathrm{~V}<\mathrm{U}_{\mathrm{N}} \leq 690 \mathrm{~V}$ | Reinforced $\mathrm{U}_{\mathrm{LL}}=2000 \mathrm{~V}$ |

### 8.5.5 Motor Bearing Currents

All motors installed with FC 30290 kW or higher power drives should have NDE (Non-Drive End) insulated bearings installed to eliminate circulating bearing currents. To minimize DE (Drive End) bearing and shaft currents proper grounding of the drive, motor, driven machine, and motor to the driven machine is required.

## Standard Mitigation Strategies:

1. Use an insulated bearing
2. Apply rigorous installation procedures

- Ensure the motor and load motor are aligned
- Strictly follow the EMC Installation guideline
- Reinforce the PE so the high frequency impedance is lower in the PE than the input power leads
- Provide a good high frequency connection between the motor and the frequency converter for instance by screened cable which has a $360^{\circ}$ connection in the motor and the frequency converter
- Make sure that the impedance from frequency converter to building ground is lower that the grounding impedance of the machine. This can be difficult for pumps
- Make a direct earth connection between the motor and load motor

3. Lower the IGBT switching frequency
4. Modify the inverter waveform, $60^{\circ} \mathrm{AVM}$ vs. SFAVM
5. Install a shaft grounding system or use an isolating coupling
6. Apply conductive lubrication
7. Use minimum speed settings if possible
8. Try to ensure the line voltage is balanced to ground. This can be difficult for IT, $\mathrm{T}, \mathrm{TN}-\mathrm{CS}$ or Grounded leg systems
9. Use a dU/dt or sinus filter

### 8.6 Control Cables and Terminals

### 8.6.1 Access to Control Terminals

All terminals to the control cables are located underneath the terminal cover on the front of the frequency converter. Remove the terminal cover by means of a screwdriver (see illustration).

Illustration 8.51 Frame sizes A1, A2, A3, B3, B4, C3 and C4

Illustration 8.52 Frame sizes A5, B1, B2, C1 and C2

### 8.6.2 Control Cable Routing

Tie down all control wires to the designated control cable routing as shown in the picture. Remember to connect the shields in a proper way to ensure optimum electrical immunity.

## Fieldbus connection

Connections are made to the relevant options on the control card. For details see the relevant fieldbus instruction. The cable must be placed in the provided path
inside the frequency converter and tied down together with other control wires (see illustrations).

Illustration 8.53 Control card wiring path for the D3. Control card wiring for the D1, D2, D4, E1 and E2 use the same path.

Illustration 8.54 Control card wiring path for the F1/F3. Control card wiring for the F2/F4 use the same path.

Electrical Installation
FC 300 Design Guide

In the Chassis (IPOO) and NEMA 1 units it is also possible to connect the fieldbus from the top of the unit as shown in the following pictures. On the NEMA 1 unit a cover plate must be removed.
Kit number for fieldbus top connection: 176F1742

Illustration 8.55 Top connection for fieldbus.

Installation of 24 Volt external DC Supply
Torque: $0.5-0.6 \mathrm{Nm}$ ( 5 in-lbs)
Screw size: M3

| No. | Function |
| :--- | :--- |
| $35(-), 36(+)$ | 24 V external DC supply |

24V DC external supply can be used as low-voltage supply to the control card and any option cards installed. This enables full operation of the LCP (including parameter setting) without connection to mains. Please note that a warning of low voltage will be given when 24 VDC has been connected; however, there will be no tripping.

## AWARNING

Use 24 VDC supply of type PELV to ensure correct galvanic isolation (type PELV) on the control terminals of the frequency converter.

### 8.6.3 Control Terminals

## Control Terminals, FC 301

Drawing reference numbers:

1. 8 pole plug digital I/O.
2. 3 pole plug RS-485 Bus.
3. 6 pole analog I/O.
4. USB Connection.

Control Terminals, FC 302

## Drawing reference numbers:

1. 10 pole plug digital I/O.
2. 3 pole plug RS-485 Bus.
3. 6 pole analog I/O.
4. USB Connection.

Illustration 8.56 Control terminals (all frame sizes)

### 8.6.4 Switches S201, S202, and S801

Switches S201 (A53) and S202 (A54) are used to select a current $(0-20 \mathrm{~mA})$ or a voltage ( -10 to 10 V ) configuration of the analog input terminals 53 and 54 respectively.

Switch S801 (BUS TER.) can be used to enable termination on the RS-485 port (terminals 68 and 69).

See drawing Diagram showing all electrical terminals in section Electrical Installation.

## Default setting:

$$
\begin{aligned}
& \text { S201 (A53) }=\text { OFF (voltage input) } \\
& \text { S202 (A54) }=\text { OFF (voltage input) }
\end{aligned}
$$

S801 (Bus termination) = OFF

## NOTE

When changing the function of S201, S202 or S801 be careful not to use force for the switch over. It is recommended to remove the LCP fixture (cradle) when operating the switches. The switches must not be operated with power on the frequency converter.

### 8.6.5 Electrical Installation, Control Terminals

To mount the cable to the terminal:

1. Strip insulation of $9-10 \mathrm{~mm}$
2. Insert a screwdriver ${ }^{1}$ ) in the square hole.
3. Insert the cable in the adjacent circular hole.
4. Remove the screw driver. The cable is now mounted to the terminal.

To remove the cable from the terminal:

1. Insert a screwdriver ${ }^{1)}$ in the square hole.
2. Pull out the cable.

Illustration 8.582.
${ }^{1)}$ Max. $0.4 \times 2.5 \mathrm{~mm}$

Illustration 8.571

Illustration 8.593.

### 8.6.6 Basic Wiring Example

1. Mount terminals from the accessory bag to the front of the frequency converter.
2. Connect terminals 18,27 and 37 (FC 302 only) to +24V (terminal 12/13)

Default settings:
18 = Start, 5-10 Terminal 18 Digital Input [9]
27 = Stop inverse, 5-12 Terminal 27 Digital Input [6]
37 = safe stop inverse

### 8.6.7 Electrical Installation, Control Cables

Illustration 8.60 Diagram showing all electrical terminals without options.
$A=$ analog, $D=$ digital
Terminal 37 is used for Safe Stop. For instructions on Safe Stop installation please refer to the section Safe Stop Installation of the Design Guide.

* Terminal 37 is not included in FC 301 (Except FC 301 A1, which includes Safe Stop).

Relay 2 and Terminal 29, have no function in FC 301.

Very long control cables and analogue signals may in rare cases and depending on installation result in $50 / 60 \mathrm{~Hz}$ earth loops due to noise from mains supply cables. If this occurs, it may be necessary to break the screen or insert a 100 nF capacitor between screen and chassis. The digital and analogue inputs and outputs must be connected separately to the common inputs (terminal 20,55,39) of the frequency converter to avoid ground currents from both groups to affect other groups. For example, switching on the digital input may disturb the analog input signal.

Input polarity of control terminals

130BT106.10

To comply with EMC emission specifications, screened/ armoured cables are recommended. If an unscreened/ unarmoured cable is used, see section Power and Control Wiring for Unscreened Cables.. For more information, see EMC Test Results.

Electrical Installation

### 8.6.8 12-Pulse Control Cables

Illustration 8.61 Diagram showing all electrical terminals without options
Terminal 37 is the input to be used for Safe Stop. For instructions on Safe Stop installation please refer to the section Safe Stop Installation in the frequency converter Design Guide. See also sections Safe Stop and Safe Stop Installation.

1) $\mathrm{F} 8 / \mathrm{F9} 9=(1)$ set of terminals.
2) $\mathrm{F} 10 / \mathrm{F} 11=(2)$ sets of terminals.
3) $F 12 / F 13=(3)$ sets of terminals.

Very long control cables and analogue signals may in rare cases and depending on installation result in $50 / 60 \mathrm{~Hz}$ earth loops due to noise from mains supply cables.

If this occurs, it may be necessary to break the screen or insert a 100 nF capacitor between screen and chassis.

The digital and analog inputs and outputs must be connected separately to the frequency converter common inputs (terminal 20,55,39) to avoid earth currents from both groups to affect other groups. For example, switching on the digital input may disturb the analog input signal.

## Input polarity of control terminals

Instruction for the frequency converter. Remember to connect the shields in a proper way to ensure optimum electrical immunity.

Connect the wires as described in the Operating

## NOTE

Control cables must be screened/armoured.

### 8.6.9 Relay Output

## Relay 1

- Terminal 01: common
- Terminal 02: normal open 240V AC
- Terminal 03: normal closed 240V AC

Relay 2 (Not FC 301)

- Terminal 04: common
- Terminal 05: normal open 400V AC
- Terminal 06: normal closed 240V AC

Relay 1 and relay 2 are programmed in 5-40 Function Relay, 5-41 On Delay, Relay, and 5-42 Off Delay, Relay.

Additional relay outputs by using option module MCB 105.

### 8.6.10 Brake Resistor Temperature Switch

## Frame size D-E-F

Torque: 0.5-0.6 Nm (5 in-lbs)
Screw size: M3

This input can be used to monitor the temperature of an externally connected brake resistor. If the input between 104 and 106 is established, the frequency converter will trip on warning / alarm 27, "Brake IGBT". If the connection is closed between 104 and 105, the frequency converter will trip on warning / alarm 27, "Brake IGBT".

A KLIXON switch must be installed that is `normally closed'. If this function is not used, 106 and 104 must be short-circuited together.
Normally closed: 104-106 (factory installed jumper)
Normally open: 104-105

| Terminal No. | Function |
| :--- | :--- |
| $106,104,105$ | Brake resistor temperature switch. |

## NOTE

If the temperature of the brake resistor gets too high and the thermal switch drops out, the frequency converter will stop braking. The motor will start coasting.

### 8.7 Additional Connections

### 8.7.1 DC Bus Connection

The DC bus terminal is used for DC back-up, with the intermediate circuit being supplied from an external source.

$$
\begin{array}{|lc}
\hline \text { Terminal numbers used: } & 88,89 \\
\hline
\end{array}
$$

Please contact Danfoss if you require further information.

### 8.7.2 Load Sharing

| Terminal No. | Function |
| :--- | :--- |
| 88,89 | Loadsharing |

The connection cable must be screened and the max. length from the frequency converter to the DC bar is limited to 25 metres ( 82 feet).
Load sharing enables linking of the DC intermediate circuits of several frequency converters.

## AWARNING

Please note that voltages up to 1099 VDC may occur on the terminals.
Load Sharing calls for extra equipment and safety considerations. For further information, see load sharing Instructions MI.50.NX.YY.

## AWARNING

Please note that mains disconnect may not isolate the frequency converter due to DC link connection

### 8.7.3 Installation of Brake Cable

The connection cable to the brake resistor must be screened and the max. length from the frequency converter to the DC bar is limited to 25 metres ( 82 feet).

1. Connect the screen by means of cable clamps to the conductive back plate on the frequency converter and to the metal cabinet of the brake resistor.
2. Size the brake cable cross-section to match the brake torque.

| No. | Function |
| :--- | :--- |
| 81,82 | Brake resistor terminals |

See Brake instructions, MI.90.FX.YY and MI.50.SX.YY for more information about safe installation.

## NOTE

If a short circuit in the brake IGBT occurs, prevent power dissipation in the brake resistor by using a mains switch or contactor to disconnect the mains for the frequency converter. Only the frequency converter shall control the contactor.

## $\triangle$ CAUTION

Please note that voltages up to 1099 VDC, depending on the supply voltage, may occur on the terminals.

## Frame size F Requirements

The brake resistor(s) must be connected to the brake terminals in each inverter module.

### 8.7.4 How to Connect a PC to the Frequency Converter

To control the frequency converter from a PC, install the MCT 10 Set-up Software.
The PC is connected via a standard (host/device) USB cable, or via the RS-485 interface as shown in the section Bus Connection in the Programming Guide.

USB is a serial bus utilizing 4 shielded wires with Ground pin 4 connected to the shield in the PC USB port.
Connecting the $P C$ to a frequency converter through the USB cable, there is a potential risk of damaging the PC USB host controller. All standard PC's are manufactured without galvanic isolation in the USB port.
Any earth ground potential difference caused by not following the recommendations described in the Operating Instructions manual "Connection to Mains and Earthing", can damage the USB host controller through the shield of the USB cable.
It is recommended to use a USB isolator with galvanic isolation to protect the PC USB host controller from earth ground potential differences, when connecting the PC to a frequency converter through a USB cable.
It is recommended not to use a PC power cable with a ground plug when the PC is connected to the frequency converter through a USB cable. It reduces the earth ground potential difference but does not eliminate all potential differences due to the Ground and shield connected in the PC USB port.

Illustration 8.62 USB connection.

### 8.7.5 The FC 300 PC Software

Data storage in PC via MCT 10 Set-Up Software:

1. Connect a PC to the unit via USB com port
2. Open MCT 10 Set-up Software
3. Select in the "network" section the USB port
4. Choose "Copy"
5. Select the "project" section
6. Choose "Paste"
7. Choose "Save as"

All parameters are now stored.

## Data transfer from PC to drive via MCT 10 Set-Up

 Software:1. Connect a PC to the unit via USB com port
2. Open MCT 10 Set-up software
3. Choose "Open"- stored files will be shown
4. Open the appropriate file
5. Choose "Write to drive"

All parameters are now transferred to the drive.

A separate manual for MCT 10 Set-up Software, MG. 10.RX.YY, is available.

### 8.8.1 High Voltage Test

Carry out a high voltage test by short-circuiting terminals $\mathrm{U}, \mathrm{V}, \mathrm{W}, \mathrm{L}_{1}, \mathrm{~L}_{2}$ and $\mathrm{L}_{3}$. Energize maximum 2.15 kV DC for 380-500V frequency converters and 2.525 kV DC for $525-690 \mathrm{~V}$ frequency converters for one second between this short-circuit and the chassis.

## AWARNING

When running high voltage tests of the entire installation, interrupt the mains and motor connection if the leakage currents are too high.

### 8.8.2 Earthing

The following basic issues need to be considered when installing a frequency converter, so as to obtain electromagnetic compatibility (EMC).

- Safety earthing: Please note that the frequency converter has a high leakage current and must be earthed appropriately for safety reasons. Apply local safety regulations.
- High-frequency earthing: Keep the earth wire connections as short as possible.

Connect the different earth systems at the lowest possible conductor impedance. The lowest possible conductor impedance is obtained by keeping the conductor as short as possible and by using the greatest possible surface area. The metal cabinets of the different devices are mounted on the cabinet rear plate using the lowest possible HF impedance. This avoids having different HF voltages for the individual devices and avoids the risk of radio interference currents running in connection cables that may be used between the devices. The radio interference will have been reduced.
In order to obtain a low HF impedance, use the fastening bolts of the devices as HF connection to the rear plate. It is necessary to remove insulating paint or similar from the fastening points.

### 8.8.3 Safety Earth Connection

The frequency converter has a high leakage current and must be earthed appropriately for safety reasons according to EN 50178

## AWARNING

The earth leakage current from the frequency converter exceeds 3.5 mA . To ensure a good mechanical connection from the earth cable to the earth connection (terminal 95), the cable cross-section must be at least $10 \mathrm{~mm}^{2}$ or 2 rated earth wires terminated separately.

### 8.9 EMC-correct Installation

### 8.9.1 Electrical Installation - EMC Precautions

The following is a guideline to good engineering practice when installing frequency converters. Follow these guidelines to comply with EN 61800-3 First environment. If the installation is in EN 61800-3 Second environment, i.e. industrial networks, or in an installation with its own transformer, deviation from these guidelines is allowed but not recommended. See also paragraphs CE Labelling, General Aspects of EMC Emission and EMC Test Results.

## Good engineering practice to ensure EMC-correct electrical installation:

- Use only braided screened/armoured motor cables and braided screened/armoured control cables. The screen should provide a minimum coverage of $80 \%$. The screen material must be metal, not limited to but typically copper, aluminium, steel or lead. There are no special requirements for the mains cable.
- Installations using rigid metal conduits are not required to use screened cable, but the motor cable must be installed in conduit separate from the control and mains cables. Full connection of the conduit from the drive to the motor is required. The EMC performance of flexible conduits varies a lot and information from the manufacturer must be obtained.
- Connect the screen/armour/conduit to earth at both ends for motor cables as well as for control cables. In some cases, it is not possible to connect the screen in both ends. If so, connect the screen at the frequency converter. See also Earthing of Braided Screened/Armoured Control Cables.
- Avoid terminating the screen/armour with twisted ends (pigtails). It increases the high frequency impedance of the screen, which reduces its effectiveness at high frequencies. Use low impedance cable clamps or EMC cable glands instead.
- Avoid using unscreened/unarmoured motor or control cables inside cabinets housing the drive(s), whenever this can be avoided.

Leave the screen as close to the connectors as possible.

Illustration 8.63 shows an example of an EMC-correct electrical installation of an IP 20 frequency converter. The frequency converter is fitted in an installation cabinet with an output contactor and connected to a PLC, which is installed in a separate cabinet. Other ways of doing the installation may have just as good an EMC performance,
provided the above guide lines to engineering practice are followed.

If the installation is not carried out according to the guideline and if unscreened cables and control wires are used, some emission requirements are not complied with, although the immunity requirements are fulfilled. See the paragraph $E M C$ test results.

Illustration 8.63 EMC-correct Electrical Installation of a Frequency Converter in Cabinet.

Illustration 8.64 Electrical Connection Diagram.

### 8.9.2 Use of EMC-Correct Cables

Danfoss recommends braided screened/armoured cables to optimise EMC immunity of the control cables and the EMC emission from the motor cables.

The ability of a cable to reduce the in- and outgoing radiation of electric noise depends on the transfer impedance $\left(Z_{T}\right)$. The screen of a cable is normally designed to reduce the transfer of electric noise; however, a screen with a lower transfer impedance $\left(\mathrm{Z}_{\mathrm{T}}\right)$ value is more effective than a screen with a higher transfer impedance ( $Z_{T}$ ).

Transfer impedance $\left(Z_{T}\right)$ is rarely stated by cable manufacturers but it is often possible to estimate transfer impedance $\left(Z_{T}\right)$ by assessing the physical design of the cable.

Transfer impedance $\left(\mathrm{Z}_{\mathrm{T}}\right)$ can be assessed on the basis of the following factors:

- The conductibility of the screen material.
- $\quad$ The contact resistance between the individual screen conductors.
- $\quad$ The screen coverage, i.e. the physical area of the cable covered by the screen - often stated as a percentage value.
- $\quad$ Screen type, i.e. braided or twisted pattern.
a. Aluminium-clad with copper wire.
b. Twisted copper wire or armoured steel wire cable.
c. Single-layer braided copper wire with varying percentage screen coverage.
This is the typical Danfoss reference cable.
d. Double-layer braided copper wire.
e. Twin layer of braided copper wire with a magnetic, screened/armoured intermediate layer.
f. Cable that runs in copper tube or steel tube.
g. Lead cable with 1.1 mm wall thickness.

### 8.9.3 Earthing of Screened Control Cables

## Correct screening

The preferred method in most cases is to secure control and serial communication cables with screening clamps provided at both ends to ensure best possible high frequency cable contact.
If the earth potential between the frequency converter and the PLC is different, electric noise may occur that will disturb the entire system. Solve this problem by fitting an equalizing cable next to the control cable. Minimum cable cross section: $16 \mathrm{~mm}^{2}$.

## 50/60Hz ground loops

With very long control cables, ground loops may occur. To eliminate ground loops, connect one end of the screen-toground with a 100nF capacitor (keeping leads short).

## Avoid EMC noise on serial communication

This terminal is connected to earth via an internal RC link. Use twisted-pair cables to reduce interference between conductors. The recommended method is shown below:

### 8.9.4 RFI Switch

## Mains supply isolated from earth

If the frequency converter is supplied from an isolated mains source ( IT mains, floating delta and grounded delta) or TT/TN-S mains with grounded leg, the RFI switch is recommended to be turned off (OFF) ${ }^{1)}$ via 14-50 RFI Filter on the drive and 14-50 RFI Filter on the filter. For further reference, see IEC 364-3. In case optimum EMC performance is needed, parallel motors are connected or the motor cable length is above 25 m , it is recommended to set 14-50 RFI Filter to [ON].
${ }^{1)}$ Not available for 525-600/690V frequency converters in frame sizes $D, E$ and $F$.
In OFF, the internal RFI capacities (filter capacitors) between the chassis and the intermediate circuit are cut off to avoid damage to the intermediate circuit and to reduce the earth capacity currents (according to IEC 61800-3).
Please also refer to the application note VLT on IT mains, MN.90.CX.02. It is important to use isolation monitors that are capable for use together with power electronics (IEC 61557-8).

Alternatively, the connection to terminal 61 can be omitted:

### 8.10.1 Mains Supply Interference/ Harmonics

A frequency converter takes up a non-sinusoidal current from mains, which increases the input current lrms. A nonsinusoidal current is transformed by means of a Fourier analysis and split up into sine-wave currents with different frequencies, i.e. different harmonic currents IN with 50 Hz as the basic frequency:

| Harmonic currents | $I_{1}$ | $I_{5}$ | $I_{7}$ |
| :--- | :---: | :---: | :---: |
| Hz | 50 Hz | 250 Hz | 350 Hz |

The harmonics do not affect the power consumption directly but increase the heat losses in the installation (transformer, cables). Consequently, in plants with a high percentage of rectifier load, maintain harmonic currents at a low level to avoid overload of the transformer and high temperature in the cables.

## NOTE

Some of the harmonic currents might disturb communication equipment connected to the same transformer or cause resonance in connection with power-factor correction batteries.

Harmonic currents compared to the RMS input current:

|  | Input current |
| :--- | :---: |
| $I_{\text {RMS }}$ | 1.0 |
| $I_{1}$ | 0.9 |
| $I_{5}$ | 0.4 |
| $I_{7}$ | 0.2 |
| $I_{11-49}$ | $<0.1$ |

To ensure low harmonic currents, the frequency converter is equipped with intermediate circuit coils as standard. DCcoils reduce the total harmonic distortion (THD) to $40 \%$.

### 8.10.2 The Effect of Harmonics in a Power Distribution System

In Illustration 8.65 a transformer is connected on the primary side to a point of common coupling PCC1, on the medium voltage supply. The transformer has an impedance $Z_{\text {xfr }}$ and feeds a number of loads. The point of common coupling where all loads are connected together is PCC2. Each load is connected through cables that have an impedance $Z_{1}, Z_{2}, Z_{3}$.

Illustration 8.65 Small Distribution System

Harmonic currents drawn by non-linear loads cause distortion of the voltage because of the voltage drop on the impedances of the distribution system. Higher impedances result in higher levels of voltage distortion.

Current distortion relates to apparatus performance and it relates to the individual load. Voltage distortion relates to system performance. It is not possible to determine the voltage distortion in the PCC knowing only the load's harmonic performance. In order to predict the distortion in the PCC the configuration of the distribution system and relevant impedances must be known.

A commonly used term for describing the impedance of a grid is the short circuit ratio Rsce, $_{\text {defined as the ratio }}$ between the short circuit apparent power of the supply at the PCC $\left(\mathrm{S}_{\text {sc }}\right)$ and the rated apparent power of the load
(S $S_{\text {equ }}$ ).
$R_{s c e}=\frac{S_{c e}}{S_{e q u}}$
where $s_{s c}=\frac{U^{2}}{z_{\text {supply }}}$ and $s_{e q u}=U \times I_{\text {equ }}$

## The negative effect of harmonics is twofold

- Harmonic currents contribute to system losses (in cabling, transformer)
- Harmonic voltage distortion causes disturbance to other loads and increase losses in other loads

### 8.10.3 Harmonic Limitation Standards and Requirements

The requirements for harmonic limitation can be:

- Application specific requirements
- Standards that must be observed

The application specific requirements are related to a specific installation where there are technical reasons for limiting the harmonics.

Example: a 250 kVA transformer with two 110 kW motors connected is sufficient if one of the motors is connected directly on-line and the other is supplied through a frequency converter. However, the transformer will be undersized if both motors are frequency converter supplied. Using additional means of harmonic reduction within the installation or choosing low harmonic drive variants makes it possible for both motors to run with frequency converters.

There are various harmonic mitigation standards, regulations and recommendations. Different standards apply in different geographical areas and industries. The following standards are the most common:

- IEC61000-3-2
- IEC61000-3-12
- IEC61000-3-4
- IEEE 519
- G5/4

See the AHF005/010 Design Guide for specific details on each standard.

### 8.10.4 Harmonic Mitigation

In cases where additional harmonic suppression is required Danfoss offers a wide range of mitigation equipment.
These are:

- VLT 12-pulse drives
- VLT AHF filters
- VLT Low Harmonic Drives
- VLT Active Filters

The choice of the right solution depends on several factors:

- The grid (background distortion, mains unbalance, resonance and type of supply (transformer/generator)
- Application (load profile, number of loads and load size)
- Local/national requirements/regulations (IEEE519, IEC, G5/4, etc.)
- Total cost of ownership (initial cost, efficiency, maintenance, etc.)

### 8.10.5 Harmonic Calculation

Determining the degree of voltage pollution on the grid and needed precaution is done with the Danfoss MCT31 calculation software. From www.danfoss.com you can download the free tool VLT ${ }^{\oplus}$ Harmonic Calculation MCT 31. The software is built with a focus on user-friendliness and limited to involve only system parameters that are normally accessible.

### 8.11 Residual Current Device - FC 300 DG

Use RCD relays, multiple protective earthing or earthing as extra protection, provided that local safety regulations are complied with.
If an earth fault appears, a DC content may develop in the faulty current.
If RCD relays are used, local regulations must be observed. Relays must be suitable for protection of 3 -phase equipment with a bridge rectifier and for a brief discharge on power-up see section Earth Leakage Current for further information.

### 8.12 Final Setup and Test

To test the set-up and ensure that the frequency converter is running, follow these steps.

## Step 1. Locate the motor name plate

The motor is either star- $(\mathrm{Y})$ or delta- connected $(\Delta)$. This information is located on the motor name plate data.

| BAUER D-7 3734 ESLINGEN |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 3~ MOTOR NR. 18274212003 |  |  |  |  |
| S/E005A9 |  |  |  |  |
|  | 1,5 | KW |  |  |
| n2 31,5 | $/ \mathrm{min}$. | 400 | Y | V |
| n 1400 | /min. |  | 50 | Hz |
| $\cos \theta \quad 0,80$ |  |  | 3,6 | A |
| 1,7L |  |  |  |  |
| B | IP 65 | H1/1 |  |  |

Step 2. Enter the motor name plate data in this parameter list.
To access this list first press the [QUICK MENU] key then select "Q2 Quick Setup".

1. 1-20 Motor Power [kW]

1-21 Motor Power [HP]
2. 1-22 Motor Voltage
3. 1-23 Motor Frequency
4. 1-24 Motor Current
5. 1-25 Motor Nominal Speed

Step 3. Activate the Automatic Motor Adaptation (AMA)
Performing an AMA will ensure optimum performance. The AMA measures the values from the motor model equivalent diagram.

1. Connect terminal 37 to terminal 12 (if terminal 37 is available).
2. Connect terminal 27 to terminal 12 or set 5-12 Terminal 27 Digital Input to 'No function'.
3. Activate the AMA 1-29 Automatic Motor Adaptation (AMA).
4. Choose between complete or reduced AMA. If a Sine-wave filter is mounted, run only the reduced AMA, or remove the Sine-wave filter during the AMA procedure.
5. Press the [OK] key. The display shows "Press [Hand on] to start".
6. Press the [Hand on] key. A progress bar indicates if the AMA is in progress.

Stop the AMA during operation

1. Press the [OFF] key - the frequency converter enters into alarm mode and the display shows that the AMA was terminated by the user.

## Successful AMA

1. The display shows "Press [OK] to finish AMA".
2. Press the $[O K]$ key to exit the AMA state.

## Unsuccessful AMA

1. The frequency converter enters into alarm mode. A description of the alarm can be found in the Warnings and Alarms chapter.
2. "Report Value" in the [Alarm Log] shows the last measuring sequence carried out by the AMA, before the frequency converter entered alarm mode. This number along with the description of the alarm will assist you in troubleshooting. If you contact Danfoss for service, make sure to mention number and alarm description.

Unsuccessful AMA is often caused by incorrectly registered motor name plate data or a too big difference between the motor power size and the frequency converter power size.

## Step 4. Set speed limit and ramp times

Set up the desired limits for speed and ramp time:
3-02 Minimum Reference
3-03 Maximum Reference
4-11 Motor Speed Low Limit [RPM] or 4-12 Motor Speed Low Limit [Hz]
4-13 Motor Speed High Limit [RPM] or 4-14 Motor Speed High Limit [Hz]

3-41 Ramp 1 Ramp up Time
3-42 Ramp 1 Ramp Down Time

Application Examples

## 9 Application Examples

## NOTE

A jumper wire may be required between terminal 12 (or 13) and terminal 27 for the frequency converter to operate when using factory default programming values. See for details.

The examples in this section are intended as a quick reference for common applications.

- Parameter settings are the regional default values unless otherwise indicated (selected in K-03 Regional Settings)
- Parameters associated with the terminals and their settings are shown next to the drawings
- Where switch settings for analog terminals A53 or A54 are required, these are also shown

Table 9.1 AMA with T27 Connected

Table 9.2 AMA without T27 Connected

Table 9.3 Analog Speed Reference (Voltage)

Table 9.10 Speed Up/Down

Table 9.12 Motor Thermistor

Table 9.11 RS-485 Network Connection

## CAUTION

Thermistors must use reinforced or double insulation to meet PELV insulation requirements.

## Table 9.13 Using SLC to Set a Relay

Table 9.14 Mechanical Brake Control

### 9.1.1 Encoder Connection

The purpose of this guideline is to ease the set-up of encoder connection to the frequency converter. Before setting up the encoder the basic settings for a closed loop speed control system will be shown.
See also 10.2 Encoder Option MCB 102

## Encoder Connection to the frequency converter

Illustration 9.124 V incremental encoder. Max. cable length 5 m .

### 9.1.2 Encoder Direction

The direction of encoder is determined by which order the pulses are entering the drive.
Clockwise direction means channel A is 90 electrical degrees before channel B.
Counter Clockwise direction means channel $B$ is 90 electrical degrees before $A$.
The direction determined by looking into the shaft end.

### 9.1.3 Closed Loop Drive System

A drive system consist usually of more elements such as:

- Motor
- Add
(Gearbox)
(Mechanical Brake)
- FC 302
- Encoder as feed-back system
- Brake resistor for dynamic braking
- Transmission
- Load

Applications demanding mechanical brake control will usually need a brake resistor.

Illustration 9.2 Basic Set-up for FC 302 Closed Loop Speed Control

### 9.1.4 Programming of Torque Limit and Stop

In applications with an external electro-mechanical brake, such as hoisting applications, it is possible to stop the frequency converter via a 'standard' stop command and simultaneously activate the external electro-mechanical brake.
The example given below illustrates the programming of frequency converter connections.
The external brake can be connected to relay 1 or 2 , see paragraph Control of Mechanical Brake. Program terminal 27 to Coast, inverse [2] or Coast and Reset, inverse [3], and program terminal 29 to Terminal mode 29 Output [1] and Torque limit \& stop [27].

## Description:

If a stop command is active via terminal 18 and the frequency converter is not at the torque limit, the motor ramps down to 0 Hz .

If the frequency converter is at the torque limit and a stop command is activated, terminal 29 Output (programmed to Torque limit and stop [27]) is activated. The signal to terminal 27 changes from 'logic 1' to 'logic 0', and the motor starts to coast, thereby ensuring that the hoist stops even if the frequency converter itself cannot handle the required torque (i.e. due to excessive overload).

- $\quad$ Start/stop via terminal 18 5-10 Terminal 18 Digital Input Start [8]
- $\quad$ Quickstop via terminal 27 5-12 Terminal 27 Digital Input Coasting Stop, Inverse [2]
- Terminal 29 Output 5-02 Terminal 29 Mode Terminal 29 Mode Output [1]
5-31 Terminal 29 Digital Output Torque Limit \& Stop [27]
- Relay output [0] (Relay 1)

5-40 Function Relay Mechanical Brake Control [32]

## 10 Options and Accessories

Danfoss offers a wide range of options and accessories for VLT AutomationDrive.

### 10.1.1 Mounting of Option Modules in Slot A

Slot A position is dedicated to Fieldbus options. For further information, see separate operating instructions.

### 10.1.2 Mounting of Option Modules in Slot B

The power to the frequency converter must be disconnected.

It is strongly recommended to make sure the parameter data is saved (i.e. by MCT 10 software) before option modules are inserted/removed from the drive.

- Remove the LCP (Local Control Panel), the terminal cover, and the LCP frame from the frequency converter.
- Fit the MCB10x option card into slot B.
- Connect the control cables and relieve the cable by the enclosed cable strips.
* Remove the knock out in the extended LCP frame, so that the option will fit under the extended LCP frame.
- Fit the extended LCP frame and terminal cover.
- Fit the LCP or blind cover in the extended LCP frame.
- Connect power to the frequency converter.
- Set up the input/output functions in the corresponding parameters, as mentioned in 4.5 General Specifications.

Illustration 10.1 Frame sizes A2, A3 and B3

Illustration 10.2 Frame sizes A5, B1, B2, B4, C1, C2, C3 and C4

### 10.1.3 Mounting of Options in Slot C

The power to the frequency converter must be disconnected.

It is strongly recommended to make sure the parameter data is saved (i.e. by MCT 10 software ) before option modules are inserted/removed from the drive. When installing a C option, a mounting kit is required. Please refer to the How to Order section for a list of ordering numbers. The installation is illustrated using MCB 112 as an example. For more information on installation of MCO 305, see separate operating instructions.

Illustration 10.3 Frame sizes A2, A3 and B3

Illustration 10.4 Frame sizes A5, B1, B2, B4, C1, C2, C3 and C4

If both C0 and C1 options are to be installed, the installation is carried out as shown below. Note that this is only possible for frame sizes A2, A3 and B3.

Illustration 10.5 Frame sizes A2, A3 and B3

### 10.2 General Purpose Input Output Module MCB 101

MCB 101 is used for extension of digital and analog inputs and outputs of FC 301 and FC 302.

Contents: MCB 101 must be fitted into slot B in the VLT AutomationDrive.

- MCB 101 option module
- Extended fixture for LCP
- Terminal cover

### 10.2.1 Galvanic Isolation in the MCB 101

Digital/analog inputs are galvanically isolated from other inputs/outputs on the MCB 101 and in the control card of the frequency converter. Digital/analog outputs in the MCB 101 are galvanically isolated from other inputs/outputs on the MCB 101, but not from these on the control card of the drive.

If the digital inputs 7,8 or 9 are to be switched by use of the internal 24 V power supply (terminal 9 ) the connection
between terminal 1 and 5 which is illustrated in the drawing has to be established.

[^10]
### 10.2.2 Digital Inputs - Terminal X30/1-4:

Digital input:
Number of digital inputs
Terminal number
Logic
Voltage level
Voltage level, logic'0' PNP (GND $=0 \mathrm{OV}$ )
Voltage level, logic'1' PNP (GND $=0 \mathrm{~V}$ )
Voltage level, logic 0 ' $\mathrm{NPN}(\mathrm{GND}=24 \mathrm{~V}$ )
Voltage level, logic 11 NPN $(\mathrm{GND}=24 \mathrm{~V}$ )
Maximum voltage on input

### 10.2.3 Analog Inputs - Terminal X30/11, 12:

Analog input:
Number of analog inputs 2
Terminal number $\quad$ X30.11, X30.12
Modes Voltage
Voltage level $0-10 \mathrm{~V}$
Input impedance $\longrightarrow \quad>10 \mathrm{k} \Omega$
Max. voltage 20 V

Resolution for analog inputs 10 bit (+ sign)
Accuracy of analog inputs Max. error 0.5\% of full scale
Bandwidth FC 301: 20Hz/ FC 302: 100Hz

### 10.2.4 Digital Outputs - Terminal X30/6, 7:

Digital output:
Number of digital outputs 2
Terminal number

Voltage level at digital/frequency output $0-24 \mathrm{~V}$
Max. output current 40 mA
Max. load $\geq 600 \Omega$
Max. capacitive load $<10 \mathrm{nF}$

Maximum output frequency $\quad \leq 32 \mathrm{kHz}$
Accuracy of frequency output
Max. error: $0.1 \%$ of full scale

### 10.2.5 Analog Output - Terminal X30/8:

Analog output:
Number of analog outputs 1
Terminal number $\quad 30.8$
Current range at analog output 0 0-20man
Max. load GND - analog output $500 \Omega$
Accuracy on analog output Max. error: $0.5 \%$ of full scale
Resolution on analog output 12 bit

### 10.3 Encoder Option MCB 102

The encoder module can be used as feedback source for closed loop Flux control (1-02 Flux Motor Feedback Source) as well as closed loop speed control (7-00 Speed PID Feedback Source). Configure encoder option in parameter group 17-xx

## Used for

- VVC ${ }^{\text {plus }}$ closed loop
- Flux Vector Speed control
- Flux Vector Torque control
- Permanent magnet motor

## Supported encoder types:

Incremental encoder: 5 V TL type, RS422, max. frequency: 410 kHz
Incremental encoder: 1Vpp, sine-cosine
Hiperface ${ }^{\circledR}$ Encoder: Absolute and Sine-Cosine (Stegmann/ SICK)

EnDat encoder: Absolute and Sine-Cosine (Heidenhain) Supports version 2.1
SSI encoder: Absolute
Encoder monitor:
The 4 encoder channels ( $\mathrm{A}, \mathrm{B}, \mathrm{Z}$, and D ) are monitored, open and short circuit can be detected. There is a green LED for each channel which lights up when the channel is OK.

## NOTE

The LEDs are only visible when removing the LCP. Reaction in case of an encoder error can be selected in 17-61 Feedback Signal Monitoring: None, Warning or Trip.

When the encoder option kit is ordered separately the kit includes:

- Encoder Option MCB 102
- Enlarged LCP fixture and enlarged terminal cover

The encoder option does not support FC 302 frequency converters manufactured before week 50/2004.
Min. software version: 2.03 (15-43 Software Version)

| Connector Designation X31 | Incremental Encoder (please refer to Graphic A) | SinCos Encoder Hiperface (please refer to Graphic B) | EnDat Encoder | SSI Encoder | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | NC |  |  | 24 V * | 24V Output (21-25V, $\mathrm{Imax}_{\text {ma }} 125 \mathrm{~mA}$ ) |
| 2 | NC | 8 Vcc |  |  | 8 V Output ( $7-12 \mathrm{~V}$, $\mathrm{Imax}^{\text {m }}$ 200mA) |
| 3 | 5 VCC |  | 5 Vcc | 5V* | 5 V Output ( $5 \mathrm{~V} \pm 5 \%$, $\mathrm{m}_{\text {max }}$ : 200 mA ) |

Max. cable length 150 m .

### 10.4 Resolver Option MCB 103

MCB 103 Resolver option is used for interfacing resolver motor feedback to VLT AutomationDrive. Resolvers are used basically as motor feedback device for Permanent Magnet brushless synchronous motors.

When the Resolver option is ordered separately the kit includes:

- Resolver option MCB 103
- Enlarged LCP fixture and enlarged terminal cover

| Resolver specifications: |  |
| :--- | :--- |
| Resolver Poles | $17-50$ Poles: $2 * 2$ |
| Resolver Input Voltage | $17-51$ Input Voltage: $2.0-8.0 \mathrm{Vrms}$ *7.0Vrms |
| Resolver Input <br> Frequency | $17-52$ Input Frequency: $2-15 \mathrm{kHz}$ <br> *10.0 kHz |
| Transformation ratio | $17-53$ Transformation Ratio: $0.1-1.1^{*} 0.5$ |
| Secondary input <br> voltage | Max 4 Vrms |
| Secondary load | App. $10 \mathrm{k} \Omega$ |

Motor

## NOTE

The Resolver Option MCB 103 can only be used with rotorsupplied resolver types. Stator-supplied resolvers cannot be used.

LED indicators
LED 1 is on when the reference signal is OK to resolver LED 2 is on when Cosinus signal is OK from resolver LED 3 is on when Sinus signal is OK from resolver

The LEDs are active when 17-61 Feedback Signal Monitoring is set to Warning or Trip.

Selection of parameters: 17-5x resolver Interface.

MCB 103 Resolver Option supports a various number of resolver types.

In this example a Permanent Magnet (PM) Motor is used with resolver as speed feedback. A PM motor must usually operate in flux mode.
Wiring:
The max cable length is 150 m when a twisted pair type of cable is used.

## NOTE

Resolver cables must be screened and separated from the motor cables.

## NOTE

The screen of the resolver cable must be correctly connected to the de-coupling plate and connected to chassis (earth) on the motor side.

## NOTE

Always use screened motor cables and brake chopper cables.

## Set-up example

| 1-00 Configuration Mode | Speed closed loop [1] |
| :--- | :--- |
| 1-01 Motor Control Principle | Flux with feedback [3] |
| $1-10$ Motor Construction | PM, non salient SPM [1] |
| 1-24 Motor Current | Nameplate |
| 1-25 Motor Nominal Speed | Nameplate |
| 1-26 Motor Cont. Rated Torque | Nameplate |
| AMA is not possible on PM motors | Motor data sheet |
| $1-30$ Stator Resistance (Rs) | Motor data sheet (mH) |
| 30-80 d-axis Inductance (Ld) | Motor data sheet |
| 1-39 Motor Poles | Motor data sheet |
| 1-40 Back EMF at 1000 RPM | Motor data sheet (Usually zero) |
| 1-41 Motor Angle Offset | Resolver data sheet |
| 17-50 Poles | Resolver data sheet |
| 17-51 Input Voltage | Resolver data sheet |
| 17-52 Input Frequency | Resolver data sheet |
| 17-53 Transformation Ratio | Enabled [1] |
| 17-59 Resolver Interface |  |

### 10.5 Relay Option MCB 105

The MCB 105 option includes 3 pieces of SPDT contacts and must be fitted into option slot B.
Electrical Data:
Max terminal load (AC-1) ${ }^{1)}$ (Resistive load)
Max terminal load (AC-15) $)^{11}$ (Inductive load @ $\cos \varphi$ 0.4)
Max terminal load (DC-1) ${ }^{11}$ (Resistive load)
Max terminal load (DC-13) ${ }^{11}$ (Inductive load)
Min terminal load (DC)
Max switching rate at rated load/min load

[^11]
## When the relay option kit is ordered separately the kit includes:

- Relay Module MCB 105
- Enlarged LCP fixture and enlarged terminal cover
- Label for covering access to switches S201, S202 and S801
- Cable strips for fastening cables to relay module

The relay option does not support FC 302 frequency converters manufactured before week 50/2004.

Min. software version: 2.03 (15-43 Software Version).

| A2-A3-B3 | A5-B1-B2-B4-C1-C2-C3-C4 |
| :--- | :---: |

## $\triangle$ WARNING

## Warning Dual supply

How to add the MCB 105 option:

- The power to the frequency converter must be disconnected.
- The power to the live part connections on relay terminals must be disconnected.
- Remove the LCP, the terminal cover and the LCP fixture from the frequency converter.
- Fit the MCB 105 option in slot B.
- Connect the control cables and fasten the cables with the enclosed cable strips.
- Make sure the length of the stripped wire is correct (see the following drawing).
- Do not mix live parts (high voltage) with control signals (PELV).
- Fit the enlarged LCP fixture and enlarged terminal cover.
- Replace the LCP.
- Connect power to the frequency converter.
- $\quad$ Select the relay functions in 5-40 Function Relay [6-8], 5-41 On Delay, Relay [6-8] and 5-42 Off Delay, Relay [6-8].

## NOTE

Array [6] is relay 7, array [7] is relay 8, and array [8] is relay 9

## AWARNING

Do not combine $24 / 48 \mathrm{~V}$ systems with high voltage
10.6 24V Back-Up Option MCB 107 systems.

External 24V DC Supply

An external 24V DC supply can be installed for low-voltage supply to the control card and any option card installed. This enables full operation of the LCP (including the parameter setting) without connection to mains.

External 24 V DC supply specification:
Input voltage range
Max. input current
Average input current for FC 302
Max cable length
Input capacitance load
Power-up delay

The inputs are protected.

## Terminal numbers:

Terminal 35: - external 24 V DC supply.
Terminal 36: + external 24V DC supply.

## Follow these steps:

1. Remove the LCP or Blind Cover
2. Remove the Terminal Cover
3. Remove the Cable Decoupling Plate and the plastic cover underneath
4. Insert the 24 V DC Back-up External Supply Option in the Option Slot
5. Mount the Cable Decoupling Plate
6. Attach the Terminal Cover and the LCP or Blind Cover.

When MCB $107,24 \mathrm{~V}$ back-up option is supplying the control circuit, the internal 24 V supply is automatically disconnected.

Illustration 10.7 Connection to 24 V back-up supply on frame sizes A2 and A3.

Illustration 10.8 Connection to 24 V back-up supply on frame sizes A5, B1, B2, C1 and C2.

### 10.7 MCB 112 PTC Thermistor Card

The option makes it possible to monitor the temperature of an electrical motor through a galvanically isolated PTC thermistor input. It is a B-option for FC 302 with Safe Stop.

For information on mounting and installation of the option, please see 10.1.2 Mounting of Option Modules in Slot $B$ earlier in this section. See also 9 Application Examples for different application possibilities.

X44/ 1 and X44/ 2 are the thermistor inputs, X44/ 12 will enable safe stop of the FC 302 (T-37) if the thermistor values make it necessary and X44/ 10 will inform the FC 302 that a request for Safe Stop came from the in order to ensure a suitable alarm handling. One of the Digital Inputs of the FC 302 (or a DI of a mounted option) must be set to PTC Card 1 [80] in order to use the information from X44/ 10. 5-19 Terminal 37 Safe Stop Terminal 37 Safe Stop must be configured to the desired Safe Stop functionality (default is Safe Stop Alarm).

## ATEX Certification with FC 302

The has been certified for ATEX which means that the FC 302 together with the can now be used with motors in potentially explosive atmospheres. See the Operating Instructions for the for more information.

### 10.8 MCB 113 Extended Relay Card

The MCB 113 adds 7 digital inputs, 2 analogue outputs and 4 SPDT relays to the standard I/O of the drive for increased flexibility and to comply with the German NAMUR NE37 recommendations.
The MCB 113 is a standard C1-option for the Danfoss VLT® AutomationDrive and is automatically detected after mounting.
For information on mounting and installation of the option, please see Mounting of Option Modules in Slot C1 earlier in this chapter

Illustration 10.9 Electrical connections of MCB 113

MCB 113 can be connected to an external 24 V on X58/ in order to ensure galvanical isolation between the $\mathrm{VLT}^{\circledR}$ AutomationDrive and the option card. If galvanical isolation is not needed, the option card can be supplied through internal 24 V from the drive.

## NOTE

It is OK to combine 24 V signals with high voltage signals in the relays as long as there is one unused relay inbetween.

To setup MCB 113, use parameter groups 5-1* (Digital input), 6-7* (Analog output 3), 6-8* (Analog output 4), 14-8* (Options), 5-4* (Relays) and 16-6* (Inputs and Outputs).

## NOTE

In par. 5-4* Array [2] is relay 3, array [3] is relay 4, array [4] is relay 5 and array [5] is relay 6

## Electrical Data

Relays:

### 10.9 Brake Resistors

In applications where the motor is used as a brake, energy is generated in the motor and send back into the frequency converter. If the energy can not be transported back to the motor it will increase the voltage in the converter DC-line. In applications with frequent braking and/or high inertia loads this increase may lead to an over voltage trip in the converter and finally a shut down. Brake resistors are used to dissipate the excess energy resulting from the regenerative braking. The resistor is selected in respect to its ohmic value, its power dissipation rate and its physical size. Danfoss offers a wide variety of different resistors that are specially designed to our frequency converters. See the section Control with brake function for the dimensioning of brake resistors. Code numbers can be found in 5 How to Order.

### 10.10 LCP Panel Mounting Kit

The LCP can be moved to the front of a cabinet by using the remote built-in kit. The enclosure is the IP66. The fastening screws must be tightened with a torque of max.
1Nm.

| Technical data |  |
| :--- | :---: |
| Enclosure: | IP66 front |
| Max. cable length between and unit: | 3 m |
| Communication std: | RS485 |

### 10.11 IP21/IP 4X/ TYPE 1 Enclosure Kit

IP20/IP 4X top/ TYPE 1 is an optional enclosure element available for IP 20 Compact units.
If the enclosure kit is used, an IP 20 unit is upgraded to comply with enclosure IP 21/ 4X top/TYPE 1.

The IP 4X top can be applied to all standard IP 20 FC 30X variants.

Options and Accessories

| Dimensions |  |  |  |
| :--- | :---: | :---: | :---: |

## NOTE

Side-by-side installation is not possible when using the IP 21/IP 4X/ TYPE 1 Enclosure Kit

### 10.12 Mounting Bracket for Frame Size A5, B1, B2, C1 and C2

Step 1
Position the lower bracket and mount it with screws. Do not tighten the screws completely since this will make it difficult to mount the frequency converter.

Step 2
Measure distance $A$ or $B$, and position the upper bracket, but do not tighten it. See dimensions below

| Frame size | A5 | B1 | B2 | B3 | B4 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| IP | $55 / 66$ | $21 / 55 / 66$ | $21 / 55 / 66$ | $21 / 55 / 66$ | $21 / 55 / 66$ |
| A $[\mathrm{mm}]$ | 480 | 535 | 705 | 730 | 820 |
| B $[\mathrm{mm}]$ | 495 | 550 | 720 | 745 | 835 |
| Ordering number | 130 B 1080 | 130 B 1081 | 130 B 1082 | 130 B 1083 | 130 B 1084 |

### 10.13 Sine-wave Filters

When a motor is controlled by a frequency converter, resonance noise will be heard from the motor. This noise, which is the result of the design of the motor, arises every time an inverter switch in the frequency converter is activated. The frequency of the resonance noise thus corresponds to the switching frequency of the frequency converter.

For the FC 300, Danfoss can supply a Sine-wave filter to dampen the acoustic motor noise.

The filter reduces the ramp-up time of the voltage, the peak load voltage $U_{\text {peak }}$ and the ripple current $\Delta l$ to the motor, which means that current and voltage become almost sinusoidal. Consequently, the acoustic motor noise is reduced to a minimum.

The ripple current in the Sine-wave Filter coils, will also cause some noise. Solve the problem by integrating the filter in a cabinet or similar.

### 10.14 High Power Options

Ordering numbers for High Power options can be found in the How to Order section. The kits are described in the FC 300 High Power Operating Instructions, MG.33.UX.YY.

### 10.14.1 Frame Size F Options

## Space Heaters and Thermostat

Mounted on the cabinet interior of frame size F frequency converters, space heaters controlled via automatic thermostat help control humidity inside the enclosure, extending the lifetime of drive components in damp environments. The thermostat default settings turn on the heaters at $10^{\circ} \mathrm{C}\left(50^{\circ} \mathrm{F}\right)$ and turn them off at $15.6^{\circ} \mathrm{C}\left(60^{\circ}\right.$ F).

## Cabinet Light with Power Outlet

A light mounted on the cabinet interior of frame size $F$ frequency converters increase visibility during servicing and maintenance. The housing the light includes a power outlet for temporarily powering tools or other devices, available in two voltages:

- $230 \mathrm{~V}, 50 \mathrm{~Hz}, 2.5 \mathrm{~A}, \mathrm{CE} / \mathrm{ENEC}$
- $120 \mathrm{~V}, 60 \mathrm{~Hz}, 5 \mathrm{~A}, \mathrm{UL} / \mathrm{cUL}$

## Transformer Tap Setup

If the Cabinet Light \& Outlet and/or the Space Heaters \& Thermostat are installed Transformer T1 requires it taps to be set to the proper input voltage. A $380-480 / 500 \mathrm{~V}$ drive will initially be set to the 525 V tap and a $525-690 \mathrm{~V}$ drive will be set to the 690 V tap to insure no over-voltage of secondary equipment occurs if the tap is not changed prior to power being applied. See the table below to set
the proper tap at terminal T 1 located in the rectifier cabinet. For location in the drive, see illustration of rectifier in 8.2.2 Power Connections.

| Input Voltage Range | Tap to Select |
| :--- | :--- |
| $380 \mathrm{~V}-440 \mathrm{~V}$ | 400 V |
| $441 \mathrm{~V}-490 \mathrm{~V}$ | 460 V |
| $491 \mathrm{~V}-550 \mathrm{~V}$ | 525 V |
| $551 \mathrm{~V}-625 \mathrm{~V}$ | 575 V |
| $626 \mathrm{~V}-660 \mathrm{~V}$ | 660 V |
| $661 \mathrm{~V}-690 \mathrm{~V}$ | 690 V |

## NAMUR Terminals

NAMUR is an international association of automation technology users in the process industries, primarily chemical and pharmaceutical industries in Germany. Selection of this option provides terminals organized and labeled to the specifications of the NAMUR standard for drive input and output terminals. This requires MCB 112 PTC Thermistor Card and MCB 113 Extended Relay Card.

## RCD (Residual Current Device)

Uses the core balance method to monitor ground fault currents in grounded and high-resistance grounded systems (TN and TT systems in IEC terminology). There is a pre-warning ( $50 \%$ of main alarm set-point) and a main alarm set-point. Associated with each set-point is an SPDT alarm relay for external use. Requires an external "windowtype" current transformer (supplied and installed by customer).

- Integrated into the drive's safe-stop circuit
- IEC 60755 Type B device monitors AC, pulsed DC, and pure $D C$ ground fault currents
- LED bar graph indicator of the ground fault current level from 10-100\% of the set-point
- Fault memory
- TEST / RESET button

## Insulation Resistance Monitor (IRM)

Monitors the insulation resistance in ungrounded systems (IT systems in IEC terminology) between the system phase conductors and ground. There is an ohmic pre-warning and a main alarm set-point for the insulation level.
Associated with each set-point is an SPDT alarm relay for external use. Note: only one insulation resistance monitor can be connected to each ungrounded (IT) system.

- Integrated into the drive's safe-stop circuit
- LCD display of the ohmic value of the insulation resistance
- Fault Memory
- INFO, TEST, and RESET buttons

## IEC Emergency Stop with Pilz Safety Relay

Includes a redundant 4-wire emergency-stop push-button mounted on the front of the enclosure and a Pilz relay that monitors it in conjunction with the drive's safe-stop circuit and the mains contactor located in the options cabinet.

## Safe Stop + Pilz Relay

Provides a solution for the "Emergency Stop" option without the contactor in F-Frame drives.

## Manual Motor Starters

Provides 3-phase power for electric blowers often required for larger motors. Power for the starters is provided from the load side of any supplied contactor, circuit breaker, or disconnect switch. Power is fused before each motor starter, and is off when the incoming power to the drive is off. Up to two starters are allowed (one if a 30A, fuseprotected circuit is ordered). Integrated into the drive's safe-stop circuit.
Unit features include:

- Operation switch (on/off)
- Short-circuit and overload protection with test function
- Manual reset function

## 30 Ampere, Fuse-Protected Terminals

- 3-phase power matching incoming mains voltage for powering auxiliary customer equipment
- Not available if two manual motor starters are selected
- Terminals are off when the incoming power to the drive is off
- Power for the fused protected terminals will be provided from the load side of any supplied contactor, circuit breaker, or disconnect switch.

## 24 VDC Power Supply

- 5 amp, 120W, 24V DC
- Protected against output over-current, overload, short circuits, and over-temperature
- For powering customer-supplied accessory devices such as sensors, PLC I/O, contactors, temperature probes, indicator lights, and/or other electronic hardware
- Diagnostics include a dry DC-ok contact, a green DC-ok LED, and a red overload LED

## External Temperature Monitoring

Designed for monitoring temperatures of external system components, such as the motor windings and/or bearings. Includes five universal input modules. The modules are integrated into the drive's safe-stop circuit and can be monitored via a fieldbus network (requires the purchase of a separate module/bus coupler).

## Universal inputs (5)

Signal types:

- RTD inputs (including PT100), 3-wire or 4-wire
- Thermocouple
- Analog current or analog voltage

Additional features:

- One universal output, configurable for analog voltage or analog current
- Two output relays (N.O.)
- Dual-line LC display and LED diagnostics
- Sensor lead wire break, short-circuit, and incorrect polarity detection
- Interface setup software

## 11 RS-485 Installation and Set-up

### 11.1 Overview

RS485 is a two-wire bus interface compatible with multidrop network topology, i.e. nodes can be connected as a bus, or via drop cables from a common trunk line. A total of 32 nodes can be connected to one network segment. Repeaters divide network segments. Please note that each repeater functions as a node within the segment in which it is installed. Each node connected within a given network must have a unique node address, across all segments. Terminate each segment at both ends, using either the termination switch (S801) of the frequency converters or a biased termination resistor network. Always use screened twisted pair (STP) cable for bus cabling, and always follow good common installation practice.
Low-impedance earth connection of the screen at every node is important, including at high frequencies. Thus, connect a large surface of the screen to earth, for example with a cable clamp or a conductive cable gland. It may be necessary to apply potential-equalizing cables to maintain the same earth potential throughout the network. Particularly in installations with long cables.
To prevent impedance mismatch, always use the same type of cable throughout the entire network. When connecting a motor to the frequency converter, always use screened motor cable.

| Cable: Screened twisted pair (STP) |
| :--- |
| Impedance: $120 \Omega$ |
| Cable length: Max. 1200 m (including drop lines) |
| Max. 500 m station-to-station |

### 11.2 Network Connection

One or more frequency converters can be connected to a control (or master) using the RS485 standardized interface. Terminal 68 is connected to the P signal ( $\mathrm{TX}+$, $\mathrm{RX}+$ ), while terminal 69 is connected to the N signal (TX-,RX-). See drawings in 8.8.3 Earthing of Screened Control Cables

If more than one frequency converter is connected to a master, use parallel connections.

In order to avoid potential equalizing currents in the screen, earth the cable screen via terminal 61 , which is connected to the frame via an RC-link.

Illustration 11.1 Control Card Terminals

### 11.3 Bus Termination

The RS485 bus must be terminated by a resistor network at both ends. For this purpose, set switch S801 on the control card for "ON".
For more information, see 8.6.4 Switches S201, S202, and S801.

Communication protocol must be set to 8-30 Protocol.

### 11.4.1 EMC Precautions

The following EMC precautions are recommended in order to achieve interference-free operation of the RS485 network.

Relevant national and local regulations, for example regarding protective earth connection, must be observed. The RS485 communication cable must be kept away from motor and brake resistor cables to avoid coupling of high frequency noise from one cable to another. Normally a distance of 200 mm ( 8 inches) is sufficient, but keeping the greatest possible distance between the cables is generally recommended, especially where cables run in parallel over long distances. When crossing is unavoidable, the RS485 cable must cross motor and brake resistor cables at an angle of 90 degrees.

The FC protocol, also referred to as FC bus or Standard bus, is the Danfoss standard fieldbus. It defines an access technique according to the master-slave principle for communications via a serial bus.
One master and a maximum of 126 slaves can be connected to the bus. The master selects the individual slaves via an address character in the telegram. A slave itself can never transmit without first being requested to do so, and direct message transfer between the individual slaves is not possible. Communications occur in the halfduplex mode.
The master function cannot be transferred to another node (single-master system).

The physical layer is RS485, thus utilizing the RS485 port built into the frequency converter. The FC protocol supports different telegram formats:

- A short format of 8 bytes for process data.
- A long format of 16 bytes that also includes a parameter channel.
- A format used for texts.

### 11.5 Network Configuration

### 11.5.1 FC 300 Frequency Converter Set-up

Set the following parameters to enable the FC protocol for the frequency converter.

| Parameter Number | Setting |
| :--- | :--- |
| $8-30$ Protocol | FC |
| 8 -31 Address | $1-126$ |
| $8-32$ FC Port Baud Rate | $2400-115200$ |
| $8-33$ Parity / Stop Bits | Even parity, 1 stop bit (default) |

### 11.6 FC Protocol Message Framing Structure - FC 300

### 11.6.1 Content of a Character (byte)

Each character transferred begins with a start bit. Then 8 data bits are transferred, corresponding to a byte. Each character is secured via a parity bit. This bit is set at "1" when it reaches parity. Parity is when there is an equal number of 1 s in the 8 data bits and the parity bit in total. A stop bit completes a character, thus consisting of 11 bits in all.

### 11.6.2 Telegram Structure

Each telegram has the following structure:

1. Start character $(S T X)=02 \mathrm{Hex}$
2. A byte denoting the telegram length (LGE)
3. A byte denoting the frequency converter address (ADR)

A number of data bytes (variable, depending on the type of telegram) follows.

A data control byte $(\mathrm{BCC})$ completes the telegram.

### 11.6.3 Length (LGE)

The length is the number of data bytes plus the address byte $A D R$ and the data control byte $B C C$.

The length of telegrams with 4 data bytes is
LGE $=4+1+1=6$ bytes
LGE $=12+1+1=14$ bytes
$10^{1)}+n$ bytes
The length of telegrams containing texts is

1) The 10 represents the fixed characters, while the " $n$ " is variable (depending on the length of the text).

### 11.6.4 Frequency Converter Address (ADR)

Two different address formats are used.
The address range of the frequency converter is either 1-31 or 1-126.

1. Address format 1-31:

Bit $7=0$ (address format 1-31 active)
Bit 6 is not used
Bit $5=1$ : Broadcast, address bits (0-4) are not used

Bit $5=0$ : No Broadcast
Bit 0-4 = frequency converter address 1-31
2. Address format 1-126:

Bit $7=1$ (address format 1-126 active)
Bit 0-6 $=$ frequency converter address 1-126
Bit 0-6 $=0$ Broadcast
The slave returns the address byte unchanged to the master in the response telegram.

### 11.6.6 The Data Field

The structure of data blocks depends on the type of . There are three types, and the type applies for both control telegrams (master=>slave) and response telegrams (slave=>master).

The 3 types of are:

## Process block (PCD)

The PCD is made up of a data block of 4 bytes ( 2 words) and contains:

- $\quad$ Control word and reference value (from master to slave)
- Status word and present output frequency (from slave to master)

## Parameter block

The parameter block is used to transfer parameters between master and slave. The data block is made up of 12 bytes (6 words) and also contains the process block.

## Text block

The text block is used to read or write texts via the data block.

### 11.6.7 The PKE Field

The PKE field contains two sub-fields: Parameter command and response AK, and Parameter number PNU:

Bits no. 12-15 transfer parameter commands from master to slave and return processed slave responses to the master.

| Parameter commands master $\Rightarrow$ slave |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit no. |  |  | 14 | 13 |
| 15 | 0 | 0 | 0 | Parameter command |
| 0 | 0 | 0 | 1 |  |
| 0 | 0 | 1 | 0 | Ro command |
| 0 | 0 | 1 | 1 | Write parameter value in RAM (word) |
| 0 | 1 | 0 | 1 | Write parameter value in RAM (double word) |
| 1 | 1 | 1 | 0 | Write parameter value in RAM and EEprom (double word) |
| 1 | 1 | 1 | 1 | Read/write text |
| 1 |  |  |  |  |

| Response slave $\Rightarrow$ master |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit no. | 14 | 13 | 12 | Response |
| 15 | 0 | 0 | 0 | No response |
| 0 | 0 | 0 | 1 | Parameter value transferred (word) |
| 0 | 0 | 1 | 0 | Parameter value transferred (double word) |
| 0 | 1 | 1 | 1 | Command cannot be performed |
| 0 | 1 | 1 | 1 | text transferred |
| 1 |  |  |  |  |

If the command cannot be performed, the slave sends this response:
0111 Command cannot be performed

- and issues the following fault report in the parameter value (PWE):

| PWE low (Hex) | Fault Report |
| :---: | :--- |
| 0 | The parameter number used does not exit |
| 1 | There is no write access to the defined parameter |
| 2 | Data value exceeds the parameter's limits |
| 3 | The sub index used does not exit |
| 4 | The parameter is not the array type |
| 5 | The data type does not match the defined parameter |
| 11 | Data change in the defined parameter is not possible in the frequency converter's present mode. Certain <br> parameters can only be changed when the motor is turned off |
| 82 | There is no bus access to the defined parameter |
| 83 | Data change is not possible because factory setup is selected |

### 11.6.8 Parameter Number (PNU)

Bits no. 0-11 transfer parameter numbers. The function of the relevant parameter is defined in the parameter description in the Programming Guide, MG.33.MX.YY.

### 11.6.9 Index (IND)

The index is used together with the parameter number to read/write-access parameters with an index, e.g.
15-30 Alarm Log: Error Code. The index consists of 2 bytes, a low byte and a high byte.

Only the low byte is used as an index.

### 11.6.10 Parameter Value (PWE)

The parameter value block consists of 2 words ( 4 bytes), and the value depends on the defined command (AK). The master prompts for a parameter value when the PWE block contains no value. To change a parameter value (write), write the new value in the PWE block and send from the master to the slave.

When a slave responds to a parameter request (read command), the present parameter value in the PWE block is transferred and returned to the master. If a parameter contains not a numerical value but several data options, e.g. 0-01 Language where [0] corresponds to English, and [4] corresponds to Danish, select the data value by entering the value in the PWE block. See Example Selecting a data value. Serial communication is only

RS-485 Installation and Set...
capable of reading parameters containing data type 9 (text string).

15-40 FC Type to 15-53 Power Card Serial Number contain data type 9.
For example, read the unit size and mains voltage range in 15-40 FC Type. When a text string is transferred (read), the length of the is variable, and the texts are of different lengths. The length is defined in the second byte of the, LGE. When using text transfer the index character indicates whether it is a read or a write command.

To read a text via the PWE block, set the parameter command (AK) to 'F' Hex. The index character high-byte must be " 4 ".

Some parameters contain text that can be written to via the serial bus. To write a text via the PWE block, set the parameter command (AK) to ' F ' Hex. The index characters high-byte must be " 5 ".

### 11.6.11 Data Types Supported by FC 300

Unsigned means that there is no operational sign in the .

| Data types | Description |
| :--- | :--- |
| 3 | Integer 16 |
| 4 | Integer 32 |
| 5 | Unsigned 8 |
| 6 | Unsigned 16 |
| 7 | Unsigned 32 |
| 9 | Text string |
| 10 | Byte string |
| 13 | Time difference |
| 33 | Reserved |
| 35 | Bit sequence |

### 11.6.12 Conversion

The various attributes of each parameter are displayed in the section Factory Settings. Parameter values are transferred as whole numbers only. Conversion factors are therefore used to transfer decimals.

4-12 Motor Speed Low Limit [Hz] has a conversion factor of 0.1.

To preset the minimum frequency to 10 Hz , transfer the value 100 . A conversion factor of 0.1 means that the value
transferred is multiplied by 0.1. The value 100 is thus perceived as 10.0.

## Examples:

Os --> conversion index 0
0.00 s --> conversion index -2

Oms --> conversion index -3
0.00 ms --> conversion index -5

| Conversion index | Conversion factor |
| :--- | :--- |
| 100 |  |
| 75 |  |
| 74 |  |
| 67 | 1000000 |
| 6 | 100000 |
| 5 | 10000 |
| 4 | 1000 |
| 3 | 100 |
| 2 | 10 |
| 1 | 1 |
| 0 | 0.1 |
| -1 | 0.01 |
| -2 | 0.001 |
| -3 | 0.0001 |
| -4 | 0.00001 |
| -5 | 0.000001 |
| -6 | 0.0000001 |
| -7 |  |

Table 11.1 Conversion table

### 11.6.13 Process Words (PCD)

The block of process words is divided into two blocks of 16 bits, which always occur in the defined sequence.

| PCD 1 | PCD 2 |
| :--- | :---: |
| Control (master $\Rightarrow$ slave Control word) | Reference-value |
| Control (slave $\Rightarrow$ master) Status word | Present output <br> frequency |

### 11.7 Examples

### 11.7.1 Writing a Parameter Value

Change 4-14 Motor Speed High Limit [Hz] to 100 Hz . Write the data in EEPROM.

PKE = E19E Hex - Write single word in 4-14 Motor Speed
High Limit [Hz]
IND $=0000 \mathrm{Hex}$
PWEHIGH $=0000$ Hex
PWELOW = 03E8 Hex - Data value 1000, corresponding to 100 Hz, see Conversion.

The telegram will look like this:

## NOTE

4-14 Motor Speed High Limit [Hz] is a single word, and the parameter command for write in EEPROM is "E". Parameter number $4-14$ is 19 E in hexadecimal.

The response from the slave to the master will be:

### 11.7.2 Reading a Parameter Value

Read the value in 3-41 Ramp 1 Ramp Up Time

PKE $=1155$ Hex - Read parameter value in 3-41 Ramp 1
Ramp Up Time
IND $=0000 \mathrm{Hex}$
PWEHIGH $=0000 \mathrm{Hex}$
PWELOW $=0000 \mathrm{Hex}$

If the value in 3-41 Ramp 1 Ramp Up Time is 10 s , the response from the slave to the master will be:

3E8 Hex corresponds to 1000 decimal. The conversion index for 3-41 Ramp 1 Ramp Up Time is -2, i.e. 0.01.
3-41 Ramp 1 Ramp Up Time is of the type Unsigned 32.

### 11.8 Modbus RTU Overview

### 11.8.1 Assumptions

Danfoss assumes that the installed controller supports the interfaces in this document, and strictly observe all requirements and limitations stipulated in the controller and frequency converter.

### 11.8.2 What the User Should Already Know

The Modbus RTU (Remote Terminal Unit) is designed to communicate with any controller that supports the interfaces defined in this document. It is assumed that the user has full knowledge of the capabilities and limitations of the controller.

### 11.8.3 Modbus RTU Overview

Regardless of the type of physical communication networks, the Modbus RTU Overview describes the process a controller uses to request access to another device. This process includes how the Modbus RTU responds to requests from another device, and how errors are detected and reported. It also establishes a common format for the layout and contents of message fields.
During communications over a Modbus RTU network, the protocol determines:

How each controller learns its device address Recognizes a message addressed to it

Determines which actions to take
Extracts any data or other information contained in the message
If a reply is required, the controller constructs the reply message and sends it.
Controllers communicate using a master-slave technique in which only one device (the master) can initiate
transactions (called queries). The other devices (slaves) respond by supplying the requested data to the master, or by taking the action requested in the query.
The master can address individual slaves, or can initiate a broadcast message to all slaves. Slaves return a message (called a response) to queries that are addressed to them individually. No responses are returned to broadcast queries from the master. The Modbus RTU protocol establishes the format for the master's query by placing into it the device (or broadcast) address, a function code defining the requested action, any data to be sent, and an error-checking field. The slave's response message is also constructed using Modbus protocol. It contains fields confirming the action taken, any data to be returned, and an error-checking field. If an error occurs in receipt of the message, or if the slave is unable to perform the requested action, the slave will construct an error message, and send it in response, or a time-out occurs.

### 11.8.4 Frequency Converter with Modbus RTU

The frequency converter communicates in Modbus RTU format over the built-in RS485 interface. Modbus RTU provides access to the Control Word and Bus Reference of the frequency converter.

The Control Word allows the Modbus master to control several important functions of the frequency converter:

- Start
- Stop of the frequency converter in various ways: Coast stop
Quick stop
DC Brake stop Normal (ramp) stop
- Reset after a fault trip
- Run at a variety of preset speeds
- Run in reverse
- Change the active set-up
- Control the frequency converter's built-in relay

The Bus Reference is commonly used for speed control. It is also possible to access the parameters, read their values, and where possible, write values to them. This permits a range of control options, including controlling the setpoint of the frequency converter when its internal PI controller is used.

### 11.9 Network Configuration

### 11.9.1 Frequency Converter with Modbus RTU

To enable Modbus RTU on the frequency converter, set the following parameters:

| Parameter | Setting |
| :--- | :--- |
| 8-30 Protocol | Modbus RTU |
| 8-31 Address | $1-247$ |
| 8-32 Baud Rate | $2400-115200$ |
| 8-33 Parity / Stop <br> Bits | Even parity, 1 stop bit (default) |

### 11.10 Modbus RTU Message Framing Structure

### 11.10.1 Frequency Converter with Modbus RTU

The controllers are set up to communicate on the Modbus network using RTU (Remote Terminal Unit) mode, with each byte in a message containing 24 -bit hexadecimal characters. The format for each byte is shown in Table 11.2.

| Start <br> bit | Data byte |  |  |  |  |  | Stop/ <br> parity | Stop |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |  |  |  |  |

| Coding System | 8-bit binary, hexadecimal 0-9, A-F. 2 <br> hexadecimal characters contained in each 8- <br> bit field of the message |
| :--- | :--- |
| Bits Per Byte | 1 start bit <br> 8 data bits, least significant bit sent first <br> 1 bit for even/odd parity; no bit for no <br> parity <br> 1 stop bit if parity is used; 2 bits if no parity |
| Error Check Field | Cyclical Redundancy Check (CRC) |

### 11.10.2 Modbus RTU Message Structure

The transmitting device places a Modbus RTU message into a frame with a known beginning and ending point. This allows receiving devices to begin at the start of the message, read the address portion, determine which device is addressed (or all devices, if the message is broadcast), and to recognise when the message is completed. Partial messages are detected and errors set as a result. Characters for transmission must be in hexadecimal 00 to FF format in each field. The frequency converter continuously monitors the network bus, also during 'silent' intervals. When the first field (the address

RS-485 Installation and Set...
field) is received, each frequency converter or device decodes it to determine which device is being addressed. Modbus RTU messages addressed to zero are broadcast messages. No response is permitted for broadcast messages. A typical message frame is shown below.

## Typical Modbus RTU Message Structure

| Start | Address | Function | Data | CRC <br> check | End |
| :---: | :---: | :---: | :---: | :---: | :---: |
| T1-T2-T3- <br> T4 | 8 bits | 8 bits | $\mathrm{N} \times 8$ <br> bits | 16 bits | T1-T2-T3- <br> T4 |

### 11.10.3 Start/Stop Field

Messages start with a silent period of at least 3.5 character intervals. This is implemented as a multiple of character intervals at the selected network baud rate (shown as Start T1-T2-T3-T4). The first field to be transmitted is the device address. Following the last transmitted character, a similar period of at least 3.5 character intervals marks the end of the message. A new message can begin after this period. The entire message frame must be transmitted as a continuous stream. If a silent period of more than 1.5 character intervals occurs before completion of the frame, the receiving device flushes the incomplete message and assumes that the next byte will be the address field of a new message. Similarly, if a new message begins prior to 3.5 character intervals after a previous message, the receiving device will consider it a continuation of the previous message. This will cause a time-out (no response from the slave), since the value in the final CRC field will not be valid for the combined messages.

### 11.10.4 Address Field

The address field of a message frame contains 8 bits. Valid slave device addresses are in the range of $0-247$ decimal. The individual slave devices are assigned addresses in the range of 1 - 247. ( 0 is reserved for broadcast mode, which all slaves recognize.) A master addresses a slave by placing the slave address in the address field of the message. When the slave sends its response, it places its own address in this address field to let the master know which slave is responding.

### 11.10.5 Function Field

The function field of a message frame contains 8 bits. Valid codes are in the range of 1-FF. Function fields are used to send messages between master and slave. When a
message is sent from a master to a slave device, the function code field tells the slave what kind of action to perform. When the slave responds to the master, it uses the function code field to indicate either a normal (errorfree) response, or that some kind of error occurred (called an exception response). For a normal response, the slave simply echoes the original function code. For an exception response, the slave returns a code that is equivalent to the original function code with its most significant bit set to logic 1. In addition, the slave places a unique code into the data field of the response message. This tells the master what kind of error occurred, or the reason for the exception. Please also refer to the sections Function Codes Supported by Modbus RTU and Exception Codes.

### 11.10.6 Data Field

The data field is constructed using sets of two hexadecimal digits, in the range of 00 to FF hexadecimal. These are made up of one RTU character. The data field of messages sent from a master to slave device contains additional information which the slave must use to take the action defined by the function code. This can include items such as coil or register addresses, the quantity of items to be handled, and the count of actual data bytes in the field.

### 11.10.7 CRC Check Field

Messages include an error-checking field, operating on the basis of a Cyclical Redundancy Check (CRC) method. The CRC field checks the contents of the entire message. It is applied regardless of any parity check method used for the individual characters of the message. The CRC value is calculated by the transmitting device, which appends the CRC as the last field in the message. The receiving device recalculates a CRC during receipt of the message and compares the calculated value to the actual value received in the CRC field. If the two values are unequal, a bus timeout results. The error-checking field contains a 16-bit binary value implemented as two 8 -bit bytes. When this is done, the low-order byte of the field is appended first, followed by the high-order byte. The CRC high-order byte is the last byte sent in the message.

RS-485 Installation and Set...

## FC 300 Design Guide

### 11.10.8 Coil Register Addressing

In Modbus, all data are organized in coils and holding registers. Coils hold a single bit, whereas holding registers hold a 2-byte word (i.e. 16 bits). All data addresses in Modbus messages are referenced to zero. The first occurrence of a data item is addressed as item number zero. For example: The coil known as 'coil 1 ' in a programmable controller is addressed as coil 0000 in the data address field of a Modbus message. Coil 127 decimal is addressed as coil 007EHEX (126 decimal).

Holding register 40001 is addressed as register 0000 in the data address field of the message. The function code field already specifies a 'holding register' operation. Therefore, the ' 4 XXXX' reference is implicit. Holding register 40108 is addressed as register 006BHEX (107 decimal).

| Coil Number | Description | Signal Direction |
| :--- | :--- | :--- |
| $1-16$ | Frequency converter control word (see table below) | Master to slave |
| $17-32$ | Frequency converter speed or set-point reference Range 0x0 - 0xFFFF $(-200 \% ~ \ldots$. <br> $\sim 200 \%)$ | Master to slave |
| $33-48$ | Frequency converter status word (see table below) | Slave to master |
| $49-64$ | Open loop mode: Frequency converter output frequency Closed loop mode: <br> frequency converter feedback signal | Slave to master |
|  | Parameter write control (master to slave) | Master to slave |
|  | $0=$ | Parameter changes are written to the RAM of the frequency <br> converter |
|  | $1=$ | Parameter changes are written to the RAM and EEPROM of the <br> frequency converter. |

| Coil | 0 | 1 |
| :--- | :--- | :--- |
| 01 | Preset reference LSB |  |
| 02 | Preset reference MSB |  |
| 03 | DC brake | No DC brake |
| 04 | Coast stop | No coast stop |
| 05 | Quick stop | No quick stop |
| 06 | Freeze freq. | No freeze freq. |
| 07 | Ramp stop | Start |
| 08 | No reset | Reset |
| 09 | No jog | Jog |
| 10 | Ramp 1 | Ramp 2 |
| 11 | Data not valid | Data valid |
| 12 | Relay 1 off | Relay 1 on |
| 13 | Relay 2 off | Relay 2 on |
| 14 | Set up LSB |  |
| 15 | Set up MSB | Reversing |
| 16 | No reversing |  |
| frequency converter control word (FC profile) |  |  |

| Coil | 0 | 1 |
| :--- | :--- | :--- |
| 33 | Control not ready | Control ready |
| 34 | frequency converter not |  |
| ready |  |  | frequency converter ready $\quad$ (loasting stop $\quad$ Safety closed | 35 | No alarm | Alarm |

| 50000 | Input data: frequency converter control word register (CTW). |
| 50010 | Input data: Bus reference register (REF). |
| $\ldots$ | $\ldots$ |
| 50200 | Output data: frequency converter status word register (STW). |
| 50210 | Output data: frequency converter main actual value register (MAV). |

* Used to specify the index number to be used when accessing an indexed parameter.

### 11.10.9 How to Control the Frequency Converter

This section describes codes which can be used in the function and data fields of a Modbus RTU message.

### 11.10.10 Function Codes Supported by Modbus RTU

Modbus RTU supports use of the following function codes in the function field of a message.

| Function | Function Code |
| :--- | :--- |
| Read coils | 1 hex |
| Read holding registers | 3 hex |
| Write single coil | 5 hex |
| Write single register | 6 hex |
| Write multiple coils | F hex |
| Write multiple registers | 10 hex |
| Get comm. event counter | B hex |
| Report slave ID | 11 hex |

| Function | Function <br> Code | Sub- <br> function <br> code | Sub-function |
| :--- | :--- | :--- | :--- |
| Diagnostic |  |  |  |
| s | 8 | 1 | Restart communication |
|  |  | 2 | Return diagnostic register |
|  |  | 10 | Clear counters and <br> diagnostic register |
|  |  | 11 | Return bus message count |
|  |  | Return bus communication <br> error count |  |
|  |  | 13 | Return bus exception error <br> count |
|  |  | Return slave message count |  |

### 11.10.11 Modbus Exception Codes

For a full explanation of the structure of an exception code response, please refer to , Function Field.

| Modbus Exception Codes |  |  |
| :--- | :--- | :--- |
| Co <br> de | Name | Meaning |
| 1 | Illegal <br> function | The function code received in the query is <br> not an allowable action for the server (or <br> slave). This may be because the function <br> code is only applicable to newer devices, <br> and was not implemented in the unit <br> selected. It could also indicate that the <br> server (or slave) is in the wrong state to <br> process a request of this type, for example <br> because it is not configured and is being <br> asked to return register values. |

| Modbus Exception Codes |  |  |
| :--- | :--- | :--- |
| 2 | Illegal data <br> address | The data address received in the query is <br> not an allowable address for the server (or <br> slave). More specifically, the combination of <br> reference number and transfer length is <br> invalid. For a controller with 100 registers, a <br> request with offset 96 and length 4 would <br> succeed, a request with offset 96 and length <br> 5 will generate exception 02. |
| 3 | Illegal data <br> value | A value contained in the query data field is <br> not an allowable value for server (or slave). <br> This indicates a fault in the structure of the <br> remainder of a complex request, such as <br> that the implied length is incorrect. It specif- <br> ically does NOT mean that a data item <br> submitted for storage in a register has a <br> value outside the expectation of the <br> application program, since the Modbus <br> protocol is unaware of the significance of <br> any particular value of any particular <br> register. |
| 4 | Slave device <br> failure | An unrecoverable error occurred while the <br> server (or slave) was attempting to perform <br> the requested action. |

### 11.11 How to Access Parameters

### 11.11.1 Parameter Handling

The PNU (Parameter Number) is translated from the register address contained in the Modbus read or write message. The parameter number is translated to Modbus as ( $10 \times$ parameter number) DECIMAL.

### 11.11.2 Storage of Data

The Coil 65 decimal determines whether data written to the frequency converter are stored in EEPROM and RAM (coil $65=1$ ) or only in RAM (coil $65=0$ ).

### 11.11.3 IND

The array index is set in Holding Register 9 and used when accessing array parameters.

### 11.11.4 Text Blocks

Parameters stored as text strings are accessed in the same way as the other parameters. The maximum text block size is 20 characters. If a read request for a parameter is for more characters than the parameter stores, the response is truncated. If the read request for a parameter is for fewer characters than the parameter stores, the response is space filled.

### 11.11.5 Conversion Factor

The different attributes for each parameter can be seen in the section on factory settings. Since a parameter value can only be transferred as a whole number, a conversion factor must be used to transfer decimals. Please refer to the Parameters section.

### 11.11.6 Parameter Values

## Standard Data Types

Standard data types are int16, int32, uint8, uint16 and uint32. They are stored as 4 x registers (40001-4FFFF). The parameters are read using function 03HEX "Read Holding Registers." Parameters are written using the function 6HEX "Preset Single Register" for 1 register (16 bits), and the function 10HEX "Preset Multiple Registers" for 2 registers ( 32 bits). Readable sizes range from 1 register ( 16 bits) up to 10 registers (20 characters).

## Non standard Data Types

Non standard data types are text strings and are stored as $4 x$ registers (40001-4FFFF). The parameters are read using function 03HEX "Read Holding Registers" and written using function 10HEX "Preset Multiple Registers." Readable sizes range from 1 register ( 2 characters) up to 10 registers (20 characters).

### 11.12 Danfoss FC Control Profile

### 11.12.1 Control Word According to FC Profile (8-10 Control Profile = FC profile)

| Bit | Bit value $=\mathbf{0}$ | Bit value $=\mathbf{1}$ |
| :--- | :--- | :--- |
| 00 | Reference value | external selection Isb |
| 01 | Reference value | external selection msb |
| 02 | DC brake | Ramp |
| 03 | Coasting | No coasting |
| 04 | Quick stop | Ramp |
| 05 | Hold output <br> frequency | use ramp |
| 06 | Ramp stop | Start |
| 07 | No function | Reset |
| 08 | No function | Jog |
| 09 | Ramp 1 | Ramp 2 |
| 10 | Data invalid | Data valid |
| 11 | No function | Relay 01 active |
| 12 | No function | Relay 02 active |
| 13 | Parameter set-up | selection Isb |
| 14 | Parameter set-up | selection msb |
| 15 | No function | Reverse |
|  |  |  |

## Explanation of the Control Bits

Bits 00/01
Bits 00 and 01 are used to choose between the four reference values, which are pre-programmed in 3-10 Preset Reference according to the following table:

| Programmed ref. <br> value | Parameter | Bit 01 | Bit 00 |
| :--- | :--- | :--- | :--- |
| 1 | $3-10$ Preset <br> Reference [0] | 0 | 0 |
| 2 | $3-10$ Preset <br> Reference [1] | 0 | 1 |
| 3 | $3-10$ Preset <br> Reference [2] | 1 | 0 |
| 4 | $3-10$ Preset <br> Reference [3] | 1 | 1 |

NOTE
Make a selection in 8-56 Preset Reference Select to define how Bit 00/01 gates with the corresponding function on the digital inputs.

Bit 02, DC brake:

Bit $02=$ '0' leads to DC braking and stop. Set braking current and duration in 2-01 DC Brake Current and 2-02 DC Braking Time. Bit $02=$ '1' leads to ramping.

## Bit 03, Coasting:

Bit 03 = '0': The frequency converter immediately "lets go" of the motor, (the output transistors are "shut off") and it coasts to a standstill. Bit $03=$ ' 1 ': The frequency converter starts the motor if the other starting conditions are met.

Make a selection in 8-50 Coasting Select to define how Bit 03 gates with the corresponding function on a digital input.

## Bit 04, Quick stop:

Bit $04=$ '0': Makes the motor speed ramp down to stop (set in 3-81 Quick Stop Ramp Time).

## Bit 05, Hold output frequency

Bit $05=$ ' 0 ': The present output frequency (in Hz ) freezes. Change the frozen output frequency only by means of the digital inputs (5-10 Terminal 18 Digital Input to
5-15 Terminal 33 Digital Input) programmed to Speed up and Slow down.

## NOTE

If Freeze output is active, the frequency converter can only be stopped by the following:

- Bit 03 Coasting stop
- Bit 02 DC braking
- Digital input (5-10 Terminal 18 Digital Input to 5-15 Terminal 33 Digital Input) programmed to DC braking, Coasting stop, or Reset and coasting stop.

## Bit 06, Ramp stop/start:

Bit $06=$ ' 0 ': Causes a stop and makes the motor speed ramp down to stop via the selected ramp down parameter. Bit $06=$ ' 1 ': Permits the frequency converter to start the motor, if the other starting conditions are met.

Make a selection in 8-53 Start Select to define how Bit 06 Ramp stop/start gates with the corresponding function on a digital input.

Bit 07, Reset: Bit $07=$ ' 0 ': No reset. Bit $07=$ ' 1 ': Resets a trip. Reset is activated on the signal's leading edge, i.e. when changing from logic ' 0 ' to logic ' 1 '.

Bit 08, Jog:
Bit $08=$ ' 1 ': The output frequency is determined by 3-19 Jog Speed [RPM].

Bit 09, Selection of ramp 1/2:
Bit 09 = "0": Ramp 1 is active (3-41 Ramp 1 Ramp Up Time to 3-42 Ramp 1 Ramp Down Time). Bit $09=$ " 1 ": Ramp 2 (3-51 Ramp 2 Ramp Up Time to 3-52 Ramp 2 Ramp Down Time) is active.

## Bit 10, Data not valid/Data valid:

Tell the frequency converter whether to use or ignore the control word. Bit $10=$ ' 0 ': The control word is ignored. Bit $10=$ ' 1 ': The control word is used. This function is relevant because the telegram always contains the control word, regardless of the telegram type. Thus, you can turn off the
control word if you do not want to use it when updating or reading parameters.

Bit 11, Relay 01:
Bit $11=$ " 0 ": Relay not activated. Bit $11=$ " 1 ": Relay 01 activated provided that Control word bit 11 is chosen in 5-40 Function Relay.

Bit 12, Relay 04:
Bit $12=$ " 0 ": Relay 04 is not activated. Bit $12=$ " 1 ": Relay 04 is activated provided that Control word bit 12 is chosen in 5-40 Function Relay.

Bit $13 / 14$, Selection of set-up:
Use bits 13 and 14 to choose from the four menu set-ups according to the shown table: .

| Set-up | Bit $\mathbf{1 4}$ | Bit 13 |
| :---: | :---: | :---: |
| 1 | 0 | 0 |
| 2 | 0 | 1 |
| 3 | 1 | 0 |
| 4 | 1 | 1 |

The function is only possible when Multi Set-Ups is selected in 0-10 Active Set-up.

Make a selection in 8-55 Set-up Select to define how Bit $13 / 14$ gates with the corresponding function on the digital inputs.

## Bit 15 Reverse:

Bit $15=$ ' 0 ': No reversing. Bit $15=$ ' 1 ': Reversing. In the default setting, reversing is set to digital in $8-54$ Reversing Select. Bit 15 causes reversing only when Ser. communication, Logic or or Logic and is selected.

### 11.12.2 Status Word According to FC Profile (STW) (8-10 Control Profile = FC profile)

Slave-master

| Bit | Bit $=0$ | Bit $=1$ |
| :--- | :--- | :--- |
| 00 | Control not ready | Control ready |
| 01 | Drive not ready | Drive ready |
| 02 | Coasting | Enable |
| 03 | No error | Trip |
| 04 | No error | Error (no trip) |
| 05 | Reserved | - |
| 06 | No error | Triplock |
| 07 | No warning | Warning |
| 08 | Speed $\neq$ reference | Speed = reference |
| 09 | Local operation | Bus control |
| 10 | Out of frequency limit | Frequency limit OK |
| 11 | No operation | In operation |
| 12 | Drive OK | Stopped, auto start |
| 13 | Voltage OK | Voltage exceeded |
| 14 | Torque OK | Torque exceeded |
| 15 | Timer OK | Timer exceeded |

## Explanation of the Status Bits

Bit 00, Control not ready/ready
Bit $00=$ ' 0 ': The frequency converter trips. Bit $00=$ ' 1 ': The frequency converter controls are ready but the power component does not necessarily receive any power supply (in case of external 24 V supply to controls).

## Bit 01, Drive ready:

Bit 01 = ' 1 ': The frequency converter is ready for operation but the coasting command is active via the digital inputs or via serial communication.

## Bit 02, Coasting stop:

Bit 02 = ' 0 ': The frequency converter releases the motor. Bit 02 = '1': The frequency converter starts the motor with a start command.

## Bit 03, No error/trip:

Bit $03=$ ' 0 ' : The frequency converter is not in fault mode. Bit 03 = '1': The frequency converter trips. To re-establish operation, enter [Reset].

Bit 04, No error/error (no trip):
Bit 04 = '0': The frequency converter is not in fault mode. Bit $04=$ " 1 ": The frequency converter shows an error but does not trip.

Bit 05, Not used:
Bit 05 is not used in the status word.

Bit 06, No error / triplock:
Bit $06=$ ' 0 ': The frequency converter is not in fault mode.
Bit $06=" 1$ ": The frequency converter is tripped and locked.

Bit 07, No warning/warning:
Bit 07 = '0': There are no warnings. Bit $07=$ ' 1 ': A warning has occurred.

Bit 08, Speed $\neq$ reference/speed $=$ reference:
Bit 08 = '0': The motor is running but the present speed is different from the preset speed reference. It might e.g. be the case when the speed ramps up/down during start/ stop. Bit $08=$ '1': The motor speed matches the preset speed reference.

Bit 09, Local operation/bus control:
Bit 09 = '0': [STOP/RESET] is activate on the control unit or Local control in 3-13 Reference Site is selected. You cannot control the frequency converter via serial communication. Bit $09=$ ' 1 ' It is possible to control the frequency converter via the fieldbus / serial communication.

Bit 10, Out of frequency limit:
Bit $10=$ ' 0 ': The output frequency has reached the value in 4-11 Motor Speed Low Limit [RPM] or 4-13 Motor Speed High Limit [RPM]. Bit $10=$ " 1 ": The output frequency is within the defined limits.

Bit 11, No operation/in operation:
Bit $11=$ ' 0 ': The motor is not running. Bit $11=$ ' 1 ': The frequency converter has a start signal or the output frequency is greater than 0 Hz .

## Bit 12, Drive OK/stopped, autostart:

Bit 12 = '0': There is no temporary over temperature on the inverter. Bit $12=$ ' 1 ': The inverter stops because of over temperature but the unit does not trip and will resume operation once the over temperature stops.

## Bit 13, Voltage OK/limit exceeded:

Bit $13=$ ' 0 ': There are no voltage warnings. Bit $13=$ ' 1 ': The DC voltage in the frequency converter's intermediate circuit is too low or too high.

Bit $14=$ ' 0 ': The motor current is lower than the torque limit selected in $4-18$ Current Limit. Bit $14=$ ' 1 ': The torque limit in 4-18 Current Limit is exceeded.

## Bit 15, Timer OK/limit exceeded:

Bit $15=$ ' 0 ': The timers for motor thermal protection and thermal protection are not exceeded $100 \%$. Bit $15=1$ ': One of the timers exceeds $100 \%$.

All bits in the STW are set to ' 0 ' if the connection between the Interbus option and the frequency converter is lost, or an internal communication problem has occurred.

### 11.12.3 Bus Speed Reference Value

Speed reference value is transmitted to the frequency converter in a relative value in $\%$. The value is transmitted in the form of a 16 -bit word; in integers ( $0-32767$ ) the value $16384(4000 \mathrm{Hex})$ corresponds to $100 \%$. Negative figures are formatted by means of 2's complement. The Actual Output frequency (MAV) is scaled in the same way as the bus reference.
Master-slave

| CTW | Speed ref. |
| :---: | :--- |
| STW | Actual output <br> freq. |
| Slave-master  <br> ST  |  |

The reference and MAV are scaled as follows:

| -100\% | 0\% |  |  | 100\% |
| :---: | :---: | :---: | :---: | :---: |
| (C000hex) | (Ohex) |  |  | (4000hex) |
|  | Reverse |  | Forward |  |
| Par.3-03 | 0 |  |  | Par.3-03 |

Max reference Max reference

### 11.12.4 Control Word according to PROFIdrive Profile (CTW)

The Control word is used to send commands from a master (e.g. a PC) to a slave.

| Bit | Bit $=0$ | Bit $=1$ |
| :--- | :--- | :--- |
| 00 | OFF 1 | ON 1 |
| 01 | OFF 2 | ON 2 |
| 02 | OFF 3 | ON 3 |
| 03 | Coasting | No coasting |
| 04 | Quick stop | Ramp |
| 05 | Hold frequency output | Use ramp |
| 06 | Ramp stop | Start |
| 07 | No function | Reset |
| 08 | Jog 1 OFF | Jog 1 ON |
| 09 | Jog 2 OFF | Jog 2 ON |
| 10 | Data invalid | Data valid |
| 11 | No function | Slow down |
| 12 | No function | Catch up |
| 13 | Parameter set-up | Selection Isb |
| 14 | Parameter set-up | Selection msb |
| 15 | No function | Reverse |

## Explanation of the Control Bits

## Bit 00, OFF 1/ON 1

Normal ramp stops using the ramp times of the actual selected ramp.
Bit $00=$ " 0 " leads to the stop and activation of the output relay 1 or 2 if the output frequency is OHz and if [Relay
123] has been selected in 5-40 Function Relay.
When bit $00=" 1 "$, the frequency converter is in State 1 :
"Switching on inhibited".
Please refer to , at the end of this section.

## Bit 01, OFF 2/ON 2

Coasting stop
When bit $01=$ " 0 ", a coasting stop and activation of the output relay 1 or 2 occurs if the output frequency is 0 Hz and if [Relay 123] has been selected in 5-40 Function Relay. When bit $01=" 1 "$, the frequency converter is in State 1 : "Switching on inhibited". Please refer to, at the end of this section.

## Bit 02, OFF 3/ON 3

Quick stop using the ramp time of 3-81 Quick Stop Ramp Time. When bit $02=$ " 0 ", a quick stop and activation of the output relay 1 or 2 occurs if the output frequency is 0 Hz and if [Relay 123] has been selected in 5-40 Function Relay. When bit $02=" 1$ ", the frequency converter is in State 1 : "Switching on inhibited".
Please refer to , at the end of this section.

Coasting stop Bit $03=$ " 0 " leads to a stop. When bit $03=$ " 1 ", the frequency converter can start if the other start conditions are satisfied.

## NOTE

The selection in 8-50 Coasting Select determines how bit 03 is linked with the corresponding function of the digital inputs.

## Bit 04, Quick stop/Ramp

Quick stop using the ramp time of 3-81 Quick Stop Ramp Time.
When bit $04=$ " 0 ", a quick stop occurs.
When bit $04=11$ ", the frequency converter can start if the other start conditions are satisfied.

## NOTE

The selection in 8-51 Quick Stop Select determines how bit 04 is linked with the corresponding function of the digital inputs.

Bit 05, Hold frequency output/Use ramp
When bit $05=$ " 0 ", the current output frequency is being maintained even if the reference value is modified.
When bit $05=" 1 "$, the frequency converter can perform its regulating function again; operation occurs according to the respective reference value.

## Bit 06, Ramp stop/Start

Normal ramp stop using the ramp times of the actual ramp as selected. In addition, activation of the output relay 01 or 04 if the output frequency is 0 Hz if Relay 123 has been selected in 5-40 Function Relay. Bit $06=" 0$ " leads to a stop. When bit $06=" 1$ ", the frequency converter can start if the other start conditions are satisfied.

## NOTE

The selection in 8-53 Start Select determines how bit 06 is linked with the corresponding function of the digital inputs.

## Bit 07, No function/Reset

Reset after switching off.
Acknowledges event in fault buffer.
When bit $07=$ " 0 ", no reset occurs.
When there is a slope change of bit 07 to " 1 ", a reset occurs after switching off.

## Bit 08, Jog 1 OFF/ON

Activation of the pre-programmed speed in 8-90 Bus Jog 1 Speed. JOG 1 is only possible if bit $04=" 0$ " and bit $00-03$ = " 1 ".

RS-485 Installation and Set...

## FC 300 Design Guide

## Bit 09, Jog 2 OFF/ON

Activation of the pre-programmed speed in 8-91 Bus Jog 2 Speed. JOG 2 is only possible if bit $04=" 0$ and bit $00-03$ = " 1 ".

## Bit 10, Data invalid/valid

Is used to tell the frequency converter whether the control word is to be used or ignored. Bit $10=$ " 0 " causes the control word to be ignored, Bit $10=$ " 1 " causes the control word to be used. This function is relevant, because the control word is always contained in the telegram, regardless of which type of telegram is used, i.e. it is possible to turn off the control word if you do not wish to use it in connection with updating or reading parameters.

## Bit 11, No function/Slow down

Is used to reduce the speed reference value by the amount given in 3-12 Catch up/slow Down Value value. When bit 11 $=$ " 0 ", no modification of the reference value occurs. When bit $11=" 1 "$, the reference value is reduced.

## Bit 12, No function/Catch up

Is used to increase the speed reference value by the amount given in 3-12 Catch up/slow Down Value.
When bit $12=$ " 0 ", no modification of the reference value occurs.
When bit $12=" 1 "$, the reference value is increased. If both slowing down and accelerating are activated (bit 11 and $12=" 1 ")$, slowing down has priority, i.e. the speed reference value will be reduced.

Bits $13 / 14$, Set-up selection
Bits 13 and 14 are used to choose between the four parameter set-ups according to Table 11.2:

The function is only possible if Multi Set-up has been chosen in 0-10 Active Set-up. The selection in 8-55 Set-up Select determines how bits 13 and 14 are linked with the corresponding function of the digital inputs. Changing setup while running is only possible if the set-ups have been linked in 0-12 This Set-up Linked to.

| Set-up | Bit 13 | Bit 14 |
| :---: | :---: | :---: |
| 1 | 0 | 0 |
| 2 | 1 | 0 |
| 3 | 0 | 1 |
| 4 | 1 | 1 |

## Bit 15, No function/Reverse

Bit $15=$ " 0 " causes no reversing.
Bit $15=$ " 1 " causes reversing.
Note: In the factory setting reversing is set to digital in 8-54 Reversing Select.

## NOTE

Bit 15 causes reversing only when Ser. communication, Logic or or Logic and is selected.

### 11.12.5 Status Word according to PROFIdrive Profile (STW)

The Status word is used to notify a master (e.g. a PC) about the status of a slave.

| Bit | Bit $=0$ | Bit $=1$ |
| :--- | :--- | :--- |
| 00 | Control not ready | Control ready |
| 01 | Drive not ready | Drive ready |
| 02 | Coasting | Enable |
| 03 | No error | Trip |
| 04 | OFF 2 | ON 2 |
| 05 | OFF 3 | ON 3 |
| 06 | Start possible | Start not possible |
| 07 | No warning | Warning |
| 08 | Speed $\ddagger$ reference | Speed $=$ reference |
| 09 | Local operation | Bus control |
| 10 | Out of frequency limit | Frequency limit ok |
| 11 | No operation | In operation |
| 12 | Drive OK | Stopped, autostart |
| 13 | Voltage OK | Voltage exceeded |
| 14 | Torque OK | Torque exceeded |
| 15 | Timer OK | Timer exceeded |

## Explanation of the Status Bits

## Bit 00, Control not ready/ready

When bit $00=$ " 0 ", bit 00,01 or 02 of the Control word is " 0 " (OFF 1 , OFF 2 or OFF 3 ) - or the frequency converter is switched off (trip).
When bit $00=$ " 1 ", the frequency converter control is ready, but there is not necessarily power supply to the unit present (in the event of external $24 æ \mathrm{~V}$ supply of the control system).

## Bit 01, VLT not ready/ready

Same significance as bit 00 , however, there is a supply of the power unit. The frequency converter is ready when it receives the necessary start signals.

Bit 02, Coasting/Enable
When bit $02=$ " 0 ", bit 00,01 or 02 of the Control word is " 0 " (OFF 1, OFF 2 or OFF 3 or coasting) - or the frequency converter is switched off (trip).
When bit $02=$ " 1 ", bit 00,01 or 02 of the Control word is "1"; the frequency converter has not tripped.

Bit 03, No error/Trip
When bit $03=$ " 0 ", no error condition of the frequency converter exists.
When bit 03 = "1", the frequency converter has tripped and requires a reset signal before it can start.

## Bit 04, ON 2/OFF 2

When bit 01 of the Control word is " 0 ", then bit $04=00$. When bit 01 of the Control word is " 1 ", then bit $04=" 1$.

Bit 05, ON 3/OFF 3
When bit 02 of the Control word is " 0 ", then bit $05=" 0$ ". When bit 02 of the Control word is " 1 ", then bit $05=" 1$ ".

Bit 06, Start possible/Start not possible
If PROFIdrive has been selected in 8-10 Control Word Profile, bit 06 will be " 1 " after a switch-off acknowledgement, after activation of OFF2 or OFF3, and after switching on the mains voltage. Start not possible will be reset, with bit 00 of the Control word being set to " 0 " and bit 01,02 and 10 being set to "1".

## Bit 07, No warning/Warning

Bit $07=$ " 0 " means that there are no warnings.
Bit $07=" 1 "$ means that a warning has occurred.

Bit 08, Speed $\neq$ reference $/$ Speed $=$ reference
When bit $08=$ " 0 ", the current speed of the motor deviates from the set speed reference value. This may occur, for example, when the speed is being changed during start/ stop through ramp up/down.
When bit $08=" 1 "$, the current speed of the motor corresponds to the set speed reference value.

Bit 09, Local operation/Bus control
Bit $09=$ " 0 " indicates that the frequency converter has been stopped by means of the stop button on the LCP, or that [Linked to hand] or [Local] has been selected in 3-13 Reference Site.
When bit $09=" 1$ ", the frequency converter can be controlled through the serial interface.

## Bit 10, Out of frequency limit//Frequency limit OK

 When bit $10=00$ ", the output frequency is outside the limits set in 4-52 Warning Speed Low and 4-53 Warning Speed High. When bit $10=" 1$ ", the output frequency is within the indicated limits.
## Bit 11, No operation/Operation

When bit $11=$ " 0 ", the motor does not turn.
When bit $11=$ " 1 ", the frequency converter has a start
signal, or the output frequency is higher than 0 Hz .

RS-485 Installation and Set...
FC 300 Design Guide

Bit 12, Drive OK/Stopped, autostart
When bit $12=$ " 0 ", there is no temporary overloading of the inverter.
When bit $12=" 1 "$, the inverter has stopped due to overloading. However, the frequency converter has not switched off (trip) and will start again after the overloading has ended.

Bit 13, Voltage OK/Voltage exceeded
When bit $13=$ " 0 ", the voltage limits of the frequency converter are not exceeded.
When bit $13=" 1 "$, the direct voltage in the intermediate circuit of the frequency converter is too low or too high.

Bit 14, Torque OK/Torque exceeded
When bit $14=00$ ", the motor torque is below the limit selected in 4-16 Torque Limit Motor Mode and 4-17 Torque Limit Generator Mode. When bit $14=11$ ", the limit selected in 4-16 Torque Limit Motor Mode or 4-17 Torque Limit Generator Mode is exceeded.

Bit 15, Timer OK/Timer exceeded
When bit $15=00$ ", the timers for the thermal motor protection and thermal frequency converter protection have not exceeded $100 \%$.
When bit $15=" 1$ ", one of the timers has exceeded $100 \%$.
