[^0]1 Configuration with actuator away from the switch
2 Proximity of ferrous materials usually reduces sense range - typically by $50 \%$. The shape and type of material cause a wide diversity of effects.
Testing is required to determine actual sense range for specific applications. As measured on a nonferrous surface.
Gap distances are nominal make distance $\pm 20 \%$. Gap Specifications are for switch to make. Break distance is approximately 1.1 to 1.5 times make.
Biased for higher defeat resistance.
