UNDERSTANDING CATEGORY RATINGS

Get the Right Protection for the Job.

Greenlee's independent testing of select test and measurement products to meet the International Electrotechnical Commission "IEC" standards for electrical test and measurement equipment should assure you these devices can help protect from the risks of shock caused by transient high-voltage spikes in electrical distribution systems. The IEC has established a standard for test and measurement equipment overvoltage protection capacities. These established overvoltage protections can be further divided into categories. Wherever you need overvoltage protection, you should choose at least the minimum category rating appropriate to the type of work you expect to be doing.

Measurement Category I (CAT I) – is for measurements performed on low voltage circuits not directly connected to mains.

Measurement Category II (CAT II) – is for measurements performed on fixed or non-fixed local level power devices like household lighting, appliances, or office equipment. Category II equipment may also be used in Category I applications.

Measurement Category III (CAT III) – is for measurements performed at the distribution level on equipment like primary feeders or branch circuits. These circuits are usually separated from Category IV (whether utility service or other high-voltage source) by a minimum of one level of transformer isolation. Category III may also be used in Category II and Category I applications.

Measurement Category IV (CAT IV) – is for measurements performed at the primary or utility supply level; Category IV may also be used in Category III, Category II and Category I applications.
