Coupling description

General description

ROTEX® couplings are designed to transmit torque between drive and driven components via curved jaw hubs and elastomeric elements commonly known as spiders. The combination of these components provides dampening and accommodation for misalignments. This product is available in a variety of metals, elastomers and mounting configurations to meet your specific needs.

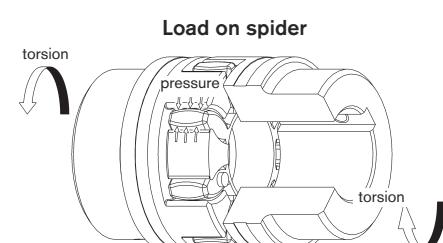

Function and Design

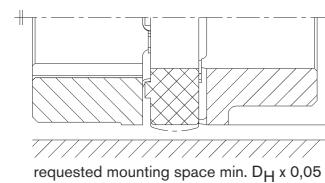

ROTEX® – couplings suitable for horizontal or vertical applications are constructed from a variety of materials and geometries providing a torsionally flexible platform optimizing the balance between inertia, coupling performance and application requirements. The machined concaved jaws provide a pocket for the crowned spider legs, allowing the hubs to articulate freely while accommodating misalignment, minimizing restoring forces, dampening shock and vibration while providing failsafe torque transmission. The symmetrical relationship of the hubs allows for a variety of accessories to accommodate different shaft distances.

Together with the curved jaw, the crowned design reduces edge loading of the ROTEX® spider while compensating for misalignment and providing system dampening. The unique geometry of the coupling, in addition to a variety of spider materials and durometers, contribute to the dampening characteristics of the system. In contrast to other flexible couplings with elastomeric elements in shear, ROTEX® coupling spiders are in compression, defining the torque of the coupling. This design characteristic results in a maximum torsional angle of 5° and minimizes spider expansion due to deformation at excessive speed/loads as illustrated.

Interlocking curved jaws with a variety of standard clamping options accommodates shafts up to 7.875 inches and a maximum nominal torque of 309,750 lb-in while still accommodating blind assembly. As defined by the spider, ROTEX couplings are suitable for moderate industrial temperature ranges. Together these features reduce the maintenance required during the life-cycle of the coupling.

Deformation with load

Explosion-proof use

ROTEX® couplings are suitable for power transmission in hazardous areas. The couplings are certified and conform to EC standard 94/9/EC (ATEX 95) as units of category 2G/2D and are suitable for use in hazardous areas of zone 1, 2, 21 and 22. Please read through our information included in our Type Examination Certificate and the operating and installation instructions at www.ktr.com.

Spiders - our innovation T-PUR®

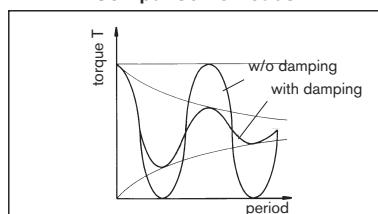

KTR has developed a new standard material for our ROTEX couplings. The improved polyurethane material, T-PUR® is able to accommodate higher application temperatures for an even longer life than our previous polyurethane. In order to see the improvement, our T-PUR® material are identified in color as; orange (92 Shore-A), purple (98 Shore-A) and pale green (64 shore-D). The previous colors yellow, red and natural white with green ends are still available for a limited time. As in the past ROTEX coupling sizes 100 to 180 utilize our DZ segments as standard, with a single element available as an option.

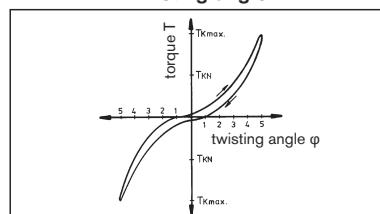

Elements DZ (double tooth elements)
standard from Size 100 -180

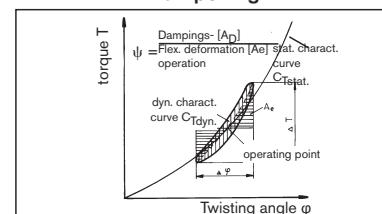

Comparison of loads

Twisting angle

Dampening

Coupling selection

The ROTEX® coupling is selected in accordance with DIN 740 part 2. The coupling must be dimensioned in a way that the permissible coupling load is not exceeded in any operating condition. For this purpose, the actual loads must be compared to the permissible parameters of the coupling.

1 Drives without periodical torsional vibrations

e. g. centrifugal pumps, fans, screw compressors, etc.
The coupling is selected taking into account the rated torques T_{KN} and maximum torque T_{Kmax} .

1.1 Load produced by rated torque

Taking ambient temperature into consideration, the permissible rated torque T_{KN} of the coupling must correspond at least to the rated torque T_N of the machine.

$$T_{KN} \geq T_N \cdot S_t$$

$$T_N [\text{lb in}] = 63025 \frac{[\text{HP}]}{[\text{RPM}]}$$

1.2 Load produced by torque shocks

The permissible maximum torque of the coupling must correspond with the total of peak torque T_S and the rated torque T_N of the machine, taking into account the shock frequency Z and the ambient temperature.

This applies in case if the rated torque T_N of the machine is at the same time subject to shocks.

Knowing the mass distribution, shock direction and shock mode, the peak torque T_S can be calculated.

For drives with A. C.-motors with high masses on the load side we would recommend the calculation of the peak driving torque with the help of our simulation program.

$$T_{Kmax} \geq T_S \cdot S_z \cdot S_t + T_N \cdot S_t$$

$$\text{Drive-sided shock } T_S = T_{AS} \cdot M_A \cdot S_A$$

$$\text{Load-sided shock } T_S = T_{LS} \cdot M_L \cdot S_L$$

$$M_A = \frac{J_L}{J_A + J_L} \quad M_L = \frac{J_A}{J_A + J_L}$$

2 Drives with periodical torsional vibrations. For drives subject to high torsional vibrations, e. g. diesel engines, piston compressors, piston pumps, generators, etc., it is necessary to perform a torsional vibration calculation to ensure safe operation. If requested, we will perform the torsional vibration calculation and the coupling selection for you. For details please contact KTR Engineering.

2.1 Load produced by rated torque

$$T_{KN} \geq T_N \cdot S_t$$

Taking ambient temperature into consideration, the permissible rated torque T_{KN} of the coupling must correspond with the rated torque T_N of the machine.

2.2 Passing through the resonance range

$$T_{Kmax} \geq T_S \cdot S_t$$

Taking ambient temperature into consideration, the peak torque T_S arising when the resonance range is run through must not exceed the maximum torque T_{Kmax} of the coupling.

2.3 Load produced by vibratory torque shocks

$$T_{KW} \geq T_W \cdot S_t$$

Taking ambient temperature into consideration, the permissible vibratory torque T_{KW} of the coupling must not be exceeded by the highest periodical vibratory torque T_W with operating speed.

For higher operating frequencies $f > 10$, the heat produced by damping in the elastomer part is considered as damping power P_W .

The permissible damping power P_{KW} of the coupling depends on the ambient temperature and must not be exceeded by the damping power produced.

$$P_{KW} \geq P_W$$

| Description | Symbol | Definition or explanation |
|---------------------------------|------------|--|
| Rated torque of coupling | T_{KN} | Torque that can continuously be transmitted over the entire permissible speed range |
| Maximum torque of coupling | T_{Kmax} | Torque that can be transmitted as dynamic load $\geq 10^5$ times or 5×10^4 as vibratory load, respectively, during the entire operating life of the coupling |
| Vibratory torque of coupling | T_{KW} | Torque amplitude of the permissible periodical torque fluctuation with a frequency of 10 Hz and a basic load of T_{KN} or dynamic load up to T_{KN} , respectively |
| Damping power of coupling | P_{KW} | Permissible damping power with an ambient temperature of $+ 86^\circ\text{F}$. |
| Rated torque of coupling | T_N | Stationary rated torque on the coupling |
| Peak torque of the machine | T_S | Peak torque on the coupling |
| Peak torque on the driving side | T_{AS} | Peak torque with torque shock on the driving side, e. g. breakdown torque of the electric motor |

| Description | Symbol | Definition or explanation |
|--|----------|--|
| Peak torque of load side | T_{LS} | Peak torque with torque shock on load side, e. g. braking |
| Vibratory torque of machine | T_W | Amplitude of the vibratory torque effective on the coupling |
| Damping power of the machine | P_W | Damping power which is effective on the coupling due to the load produced by the vibratory torque |
| Moment of inertia of driving side | J_A | Total of moments of inertia existing on the driving or load side referring to the coupling speed |
| Moment of inertia of load side | J_L | |
| Rotational inertia coefficient of driving side | M_A | Factor taking into account the mass distribution with shocks and vibrations produced on the driving or load side |
| Rotational inertia coefficient of load side | M_L | $M_A = \frac{J_L}{J_A + J_L} \quad M_L = \frac{J_A}{J_A + J_L}$ |

Allowable load on key of the coupling hub

The shaft-hub-connection has to be verified by the customer. Allowable surface pressure according to DIN 6892 (method C).

| starting frequency/h | 100 | 200 | 400 | 800 | | | S_A/S_L | |
| S_Z | 1.0 | 1.2 | 1.4 | 1.6 | gentle shocks | | 1.5 | |

| average shocks | | 1.8 |
|----------------|--|-----|
| heavy shocks | | 2.5 |

Example of selection:

Given: Details of driving side

| | | |
|-------------------------------|----------------------------------|-------------|
| A. C. motor | 449TS | $S_A = 1.8$ |
| Motor output | $P = 300 \text{ HP}$ | |
| Speed | $n = 1,750 \text{ rpm}$ | |
| Moment of inertia driven side | $J_A = 25.7 \text{ lb in sec}^2$ | |
| Start-up frequency | $z = 6^{1/2}$ | $S_Z = 1.0$ |
| Ambient temperature | $= + 140^\circ \text{F}$ | $S_t = 1.4$ |

Given: Details of load side

| | |
|---------------------------|----------------------------------|
| Screw compressor | $T_{LN} = 8,230 \text{ lb-in}$ |
| Rated torque of load side | $J_L = 60.2 \text{ lb in sec}^2$ |

Calculation

● Rated driving torque

$$T_{AN} [\text{lb-in}] = 63,025 \frac{P(\text{HP})}{n_{AN} [\text{rpm}]} \\ T_{AN} = 63,025 \cdot \frac{300 \text{ HP}}{1,750 \text{ rpm}} = 10,804 \text{ lb-in}$$

Coupling selection:

● Load produced by rated torque:

$$T_{KN} \geq T_{LN} \cdot S_t$$

$$T_{KN} \geq 8,230 \text{ lb-in} \cdot 1.4 = 11,522 \text{ lb-in}$$

Selected: ROTEX® Size 90 - spider 92 Shore A with:

$$T_{KN} = 21,240 \text{ lb-in}$$

$$T_{K \max} = 42,480 \text{ lb-in}$$

● Load produced by torque shocks:

$$T_{K \max} \geq T_S \cdot S_z \cdot S_t$$

$$\rightarrow \boxed{\text{Drive-sided shock} \\ T_S = T_{AS} \cdot M_A \cdot S_A}$$

$$\rightarrow M_A = \frac{J_L}{(J_A + J_L)} = \frac{60.2 \text{ lb-in-sec}^2}{(25.7 \text{ lb-in-sec}^2 + 60.2 \text{ lb-in-sec}^2)} = 0.7$$

$$\rightarrow \bullet \text{ Driving torque} \quad T_{AS} = 2.0 \cdot T_{AN}$$

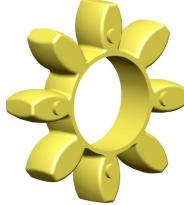

$$= 2.0 \cdot 10,804 \text{ lb-in} = 21,608 \text{ lb-in}$$

$$T_S = 21,608 \text{ lb-in} \cdot 0.7 \cdot 1.8 = 27,226 \text{ lb-in}$$

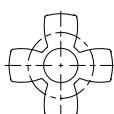

$$T_{K \max} \geq 27,226 \text{ lb-in} \cdot 1 \cdot 1.4 = 38,117 \text{ lb-in}$$

$$T_{K \max} \text{ with } 42,480 \text{ lb-in} \geq 38,117 \text{ lb-in} \quad \checkmark$$

Unless specified, Shore hardness 92 Sh-A T-PUR. For circumferential speeds exceeding V = 98 ft/sec dynamic balancing is necessary.

For circumferential speeds exceeding V = 115 ft/sec only steel or nodular iron.

For peripheral speeds exceeding V = 115 ft/sec dynamic balancing of steel or nodular iron hubs is required.

The above misalignment figures for ROTEX® couplings are standard values, taking into account the load of the coupling up to the rated torque T_{KN} and an operating speed $n = 1,800$ RPM along with an ambient temperature of + 86° F.

For other operating parameters, please ask for KTR-Norm 20240 on misalignments for ROTEX®. The maximum angular and parallel misalignments must not be used concurrently. For example; 70% of the maximum parallel value allows 30% of the maximum angular value. Also, care should be taken to accurately maintain the distance dimension "E", allowing for axial clearance of the coupling while in operation. In case of an axial thrust, the dimension "L" must be taken as a minimum dimension in order to keep the spider free from pressure against the face.

Detailed installation instructions are available at www.ktr.com.

Shaft coupling standard design – cast materials

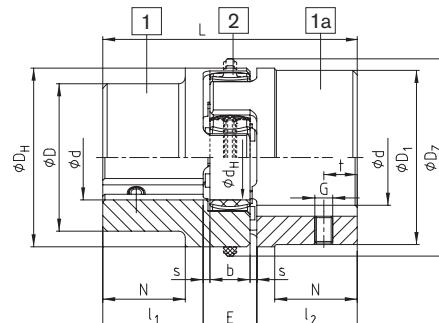

- Failsafe, reduced maintenance, blind assembly
- Torsionally flexible / vibration-damping
- Machined jaws - good dynamic properties and reduced spider wear
- Low weight cast aluminum hubs up to size 28
- Cast and nodular iron hubs from size 38 up to size 180
- Ex approved according to EC Standard 94/9/EC (Cast and Nodular Iron materials)
- Installation instructions available at www.ktr.com

Components

AL-D (thread on the keyway)

EN-GJL-250 / EN-GJS-400-15 (thread on the keyway)

Spider
as hardness 92 Sh-A
and 95/98 Sh-A
standard from size
14 - 100 and 64 Sh-D
size 14 - 180

elements DZ (double tooth elements)
as hardness 92 Sh-A
and 95 Sh-A
standard from size 110 -
180

= If material is not specified on the order, the selection/order will be based on the standard material listed above

1) Maximum torque of the coupling $T_{K\max}$ = rated torque of the coupling $T_{KN} \times 2$. For selection, please see page 20/21.

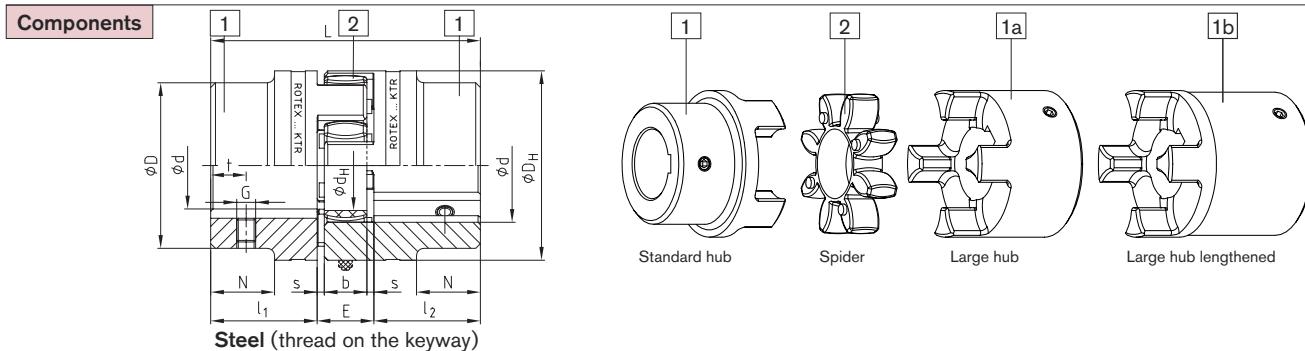

2) Material Al-H (machined aluminum).

Inch bores machined to AGMA Class 1, Metric bores machined to H7

Shaft coupling standard design – steel materials

- Failsafe, reduced maintenance, blind assembly
- Torsionally flexible / vibration-damping
- Machined jaws - good dynamic properties and reduced spider wear
- Steel hubs, for high shock applications, (e.g. steel mills, elevator drives, spline hubs, etc.)
- approved according to EC Standard 94/9/EC
- Installation instructions available at www.ktr.com

| | Coupling size | Material | Spider hardness Shore A] | Hub design | Bore | Hub design |

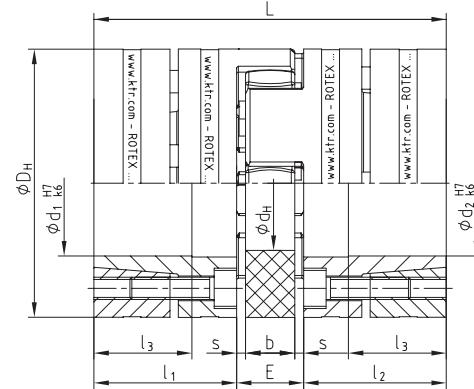

Clamping ring hubs

Same advantages as the standard ROTEX®:

- Integrated frictional clamping design
- High frictional torque capacity
- Easy installation with fasteners in the jaw pocket
- Ex approved according to EC Standard 94/9/EC (review the selection for Ex explosion protection use)
- Installation instructions available at www.ktr.com

Components

Inch bores machined to AGMA Class 1, Metric bores machined to H7 or G7 if greater than 2.157 in.

For transmittable torques of the clamping connection consider the max. tolerance to the shaft fit k6 / bore H7, from Ø55mm m6/G7. With bigger, shafts with larger tolerances the torque is reduced.

To calculate stiffness of the shaft/hollow shaft request KTR standard 45510

Steel cross clamp hubs

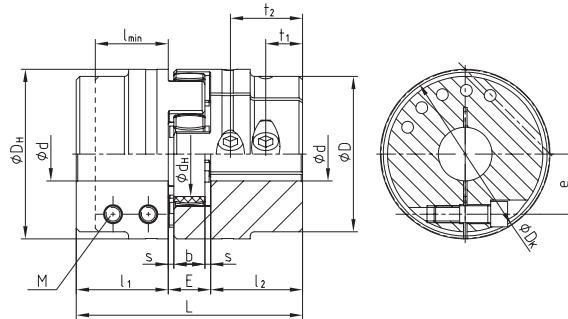

Same advantages as the standard ROTEX® in addition:

- Ideal clamping design for splined shafts
- Static balanced
- Suitable for reversing applications
- Ex protection assessed and confirmed to EU standard 94/9/EC (acceptable for hub designs 2.1 and 2.3, hub design 2.0 only to category 3)
- Installation instructions available at www.ktr.com

Flange designs AFN and BFN

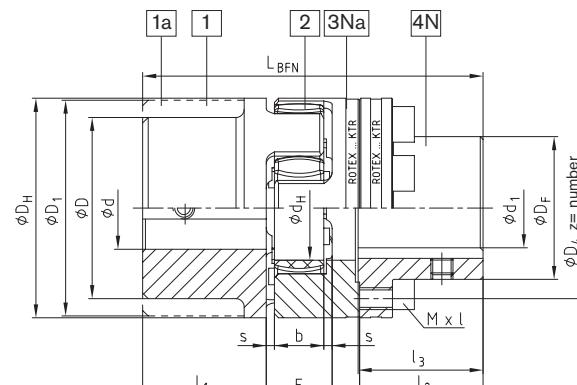

Same advantages as the standard ROTEX® in addition:

- Double flange design AFN and single flange design BFN
- Reduced maintenance, eliminates the need to move components (e.g. motor and pump)
- AFN design allows spider replacement while coupling is installed
- Flange component materials: 4N Steel
3Na Nodular Iron
EN-GJS-400-15 (GGG 40)
- Exproved according to EC Standard 94/9/EC
- Installation instructions available at www.ktr.com

Drop-out center coupling design A-H

Same advantages as the standard ROTEX® in addition:

- Complete installation and removal using only 4 fasteners
- Reduced maintenance by not having to move components (e.g. motor and pump)
- Keyed and frictional hub combinations can be installed radially (dimension E₁ for design AFN = dimension E₁ for A-H)
- Ex approved according to EC Standard 94/9/EC (design 7.8 clamping hub without key only to category 3)
- Installation instructions available at www.ktr.com

Double-cardanic spacer design ZS-DKM-H

Same advantages as the standard ROTEX® in addition:

- Standard spacers up to 9.84" shaft gap
- Complete installation and removal using only 4 fasteners
- Accommodates high shaft misalignments while remaining torsionally symmetric
- Restoring forces are reduced to a minimum
- approved according to EC Standard 94/9/EC (design 7.5 clamping hub without key according to category 3)
- Installation instructions available at www.ktr.com

Double-cardanic spacer design DKM

Same advantages as the standard ROTEX® in addition:

- Greater shaft misalignments
- 3-part double cardanic design eliminating the need for bearing support
- Restoring forces are reduced to a minimum
- approved according to EC Standard 94/9/EC (Explosion Certificate ATEX 95)
- Installation instructions available at www.ktr.com

Intermediate shaft design ZR

Same advantages as the standard ROTEX® in addition:

- Connects applications with large shaft gaps
- Compensates for greater parallel misalignments
- Allows radial installation without moving components
- ZR style - intermediate shaft coupling with the GS spider can be removed radially
- Installation instructions available at www.ktr.com

Design BTAN with brake drum/design SBAN with brake disc

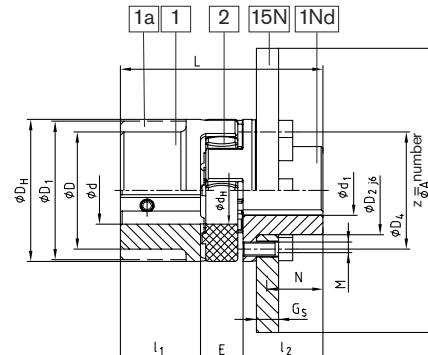

Same advantages as the standard ROTEX® in addition:

- Shaft coupling BTAN designed to be mounted to external brake drums with brake discs to DIN 5431/15435
- Shaft coupling BTAN with disc for brake calipers
- Each coupling design can be combined with several sizes of brake drums (see dimension "N")
- The brake drum or brake disc must be mounted onto the shaft with the highest mass moment of inertia
- The maximum brake torque must not exceed the maximum coupling torque
- Installation instructions available at www.ktr.com

Design AFN-SB special with brake disc

Same advantages as the standard ROTEX® in addition:

- Shaft coupling AFN-SB special with brake disc for brake calipers
- The brake disc must be mounted onto the shaft with the highest mass moment of inertia
- The maximum brake torque must not exceed the maximum coupling torque
- Installation instructions available at www.ktr.com

Design SD (shiftable at standstill)

Same advantages as the standard ROTEX® in addition:

- Shiftable coupling for all applications in general industry
- Easy to engage and disengage drive and driven at standstill
- Optional shiftable linkage kit available to ease installation
- Spring and ball detent locking mechanism
- Other sizes on request according to M 370266
- Installation instructions available at www.ktr.com

* 1. BSW thread

Coupling design TB 1/1; TB 2/2; TB 1/2 possible

Please request sheet M373054.

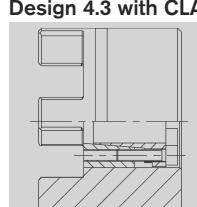

Design 4.2 with CLAMPEX® clamping set KTR 250

Frictionally engaged, backlash-free shaft-hub-connection for transmission of average torques.

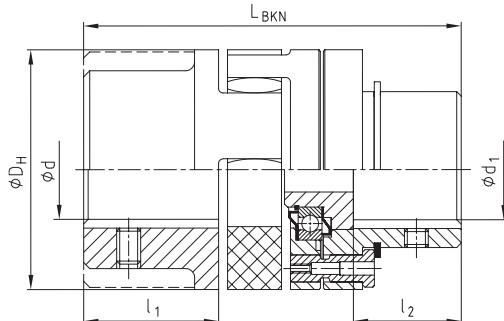

Design 4.3 with CLAMPEX® clamping set KTR 400

Frictionally engaged, backlash-free shaft-hub-connection for transmission of larger torques. Largest clamping set possible depends on the hub collar diameter. Clamping set screw fitting possible both internally and externally. For details of calculation please CLAMPEX® catalog.

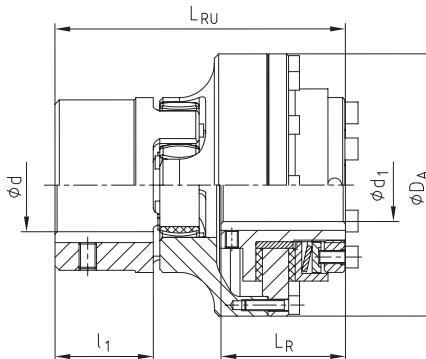

Additional designs with torque limiter

Due to the many applications of ROTEX® in several different mounting situations, this coupling system is available with various hub designs. These designs are available for either keyed or frictionally engaged connections. Installation for gear shafts with integrated jaws or similar applications are also available.

Hub designs

Due to the numerous applications of ROTEX® for many different mounting situations, this coupling system is available with various hub designs. These designs mainly differ in that they offer either positive or frictionally engaged connections, but mounting situations like, for example, gear shafts with integrated transmission cams or similar applications are covered, too.

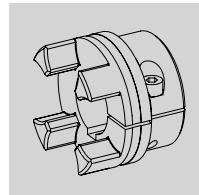

Design 1.0 hub with keyway and fixing screw

Positive locking power transmission, permissible torque depending on the permissible surface pressure. Not suitable for backlash-free power transmission with heavily reversing operation.

Design 1.1 hub without keyway with fixing

Non-positive torque transmission for crimped and glued connections (no ATEX release).

Design 1.3 hub with spline bore

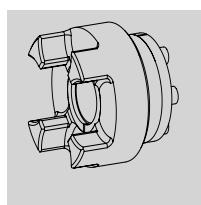

Design 2.0 clamping hub single slotted, without keyway

Positive torque transmission for pressed or glued connections. (No ATEX certification available)

Design 2.1 clamping hub, single slotted, with keyway

Positive locking power transmission with additional frictionally engaged condition. The frictionally engaged condition prevents or reduces reverse backlash, respectively. Surface pressure of the feather key connection is prevented.

Design 2.3 clamping hub with spline bore (page 33)

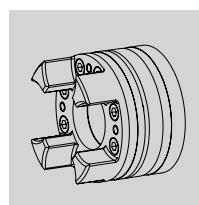

Design 4.2 with CLAMPEX® clamping set KTR 250

Frictionally engaged, backlash-free shaft-hub-connection for the transmission of average torques.

Design 4.1 with CLAMPEX® clamping set KTR 200

Design 4.3 with CLAMPEX® clamping set KTR 400
Frictionally engaged, backlash-free shaft-hub-connection for the transmission of high torques.

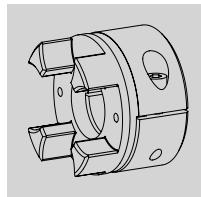

**Design 6.0 clamping ring hub
(see ROTEX® GS series)**

Integrated frictionally engaged shaft-hub-connection for the transmission of higher torques. Screwing on elastomer side. For details about torque and dimensions see page 33. Suitable for high speeds.

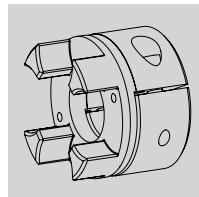

**Design 6.5 clamping ringhub
(see Rotex GS series)**

Design like 6.0, except for clamping screws externally. As an example for radial assembly of intermediate pipe (special design).

Design 7.5 shell clamping hub without feather key for a double-cardanic connection

Frictionally engaged backlash-free shaft-hub-connection for radial assembly of coupling. Transmittable torques depending on bore diameter. (for ATEX category 3 only).

Design 7.8 shell clamping hub without feather key

Frictionally engaged, backlash-free shaft-hub-connection for radial assembly of coupling. Transmittable torques depend on the bore diameter (for ATEX category 3 only).

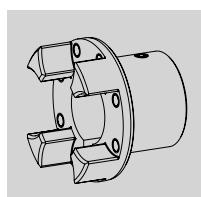

Design 7.6 shell clamping hub with feather key for a double-cardanic connection

Positive locking power transmission with additional frictionally engaged condition for radial assembly of coupling. The frictionally engaged condition prevents or reduces reverse backlash, respectively. Surface pressure of the feather key connection is prevented.

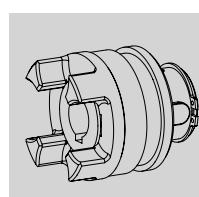

Design 7.9 shell clamping hub with feather key

Positive locking power transmission with additional backlash for radial assembly of coupling. The frictionally engaged condition prevents or reduces reverse backlash, respectively. Surface pressure of the feather key connection is prevented.

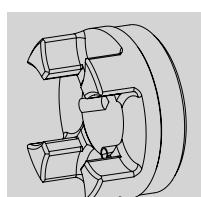

FNN hub

Coupling hub to be connected to an attachment such as brake drum, brake disk and fan.

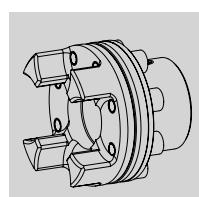

SD hub shifting hub

Coupling hub for separating or switching on the driving/driven machine with standstill of the machine. Can be combined with slip ring and shiftable linkage.

TB1/TB2 Hub

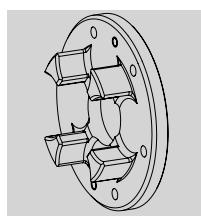

Coupling hub for taper clamping bushes.
TB1 screwed on cam side. TB2 screwed externally.

Design 3Na + 4N

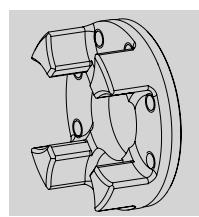

Driving flange with coupling flange

For type AFN and BFN. With type AFN the spider can be replaced while being assembled without having to disassemble the driving and driven side.

Driving flange design 3b

Driving flange to connect to customer's component. For dimensions see page 36.

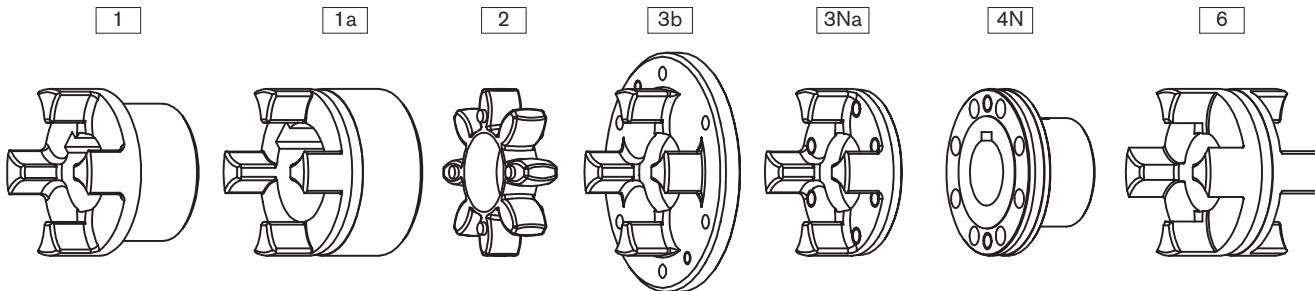

Driving flange design 3Na

Driving flange to connect to customer's component. For dimensions see page 36.

Unless specified, Shore hardness 92 Sh-A T-PUR. For circumferential speeds exceeding V = 98 ft/sec dynamic balancing is necessary.

For circumferential speeds exceeding V = 115 ft/sec only steel or nodular iron.

For peripheral speeds exceeding V = 115 ft/sec dynamic balancing of steel or nodular iron hubs is required.
