

Description:

Nelson Type CLT self-regulating heater cable is a parallel circuit electric heater strip. An irradiation cross-linked conductive polymer core material is extruded over the multi-stranded, tin-plated, 18-gauge copper bus wires. The conductive core material increases or decreases its heat output in response to temperature changes. A thermoplastic elastomer dielectric jacket is then extruded over the conductive core. A copper braid is installed over this jacket providing a continuous ground path. A UV stabilized thermoplastic elastomer overjacket is provided to cover the braid for wet applications and exposure to the sun.

Principle of Operation:

The parallel bus wires apply voltage along the entire length of the heater cable. The conductive core provides an infinite number of parallel conductive paths permitting the cable to be cut to any length in the field with no dead or cold zones developing. The heater cable derives its self-regulating characteristic from the inherent properties of the conductive core material. As the core material temperature increases, the number of conductive paths in the core material decreases, automatically decreasing the heat output. As the temperature decreases, the number of conductive paths increases, causing the heat output to increase. This occurs at every point along the length of the cable, adjusting the power output to the varying conditions along the pipe. The self-regulating effect allows the cable to be overlapped without creating hot spots or burnout. As the cable self-regulates its heat output, it provides for the efficient use of electric power, producing heat only when and where it is needed, and also limiting the maximum surface temperature.

Application:

Nelson's Type CLT self-regulating heater cable is ideal for use in maintaining fluid flow under low ambient conditions. Freeze protection and low watt density process temperature systems such as pipelines, fire protection, process water, dust suppression systems, hot water and structure anti-icing are typical applications for this product. For other than metal pipe heating, see appropriate application guide. The base product is supplied with a copper metal braid with a thermoplastic elastomer overjacket for wet applications, exposure to the sun, and where mechanical abuse is a problem.

PIPING FREEZE PROTECTION

APPLICATION INFORMATION

TYPE CLT

Cable Selection @ 0°F Minimum Ambient Temperature

Application Design Conditions	
Maintain Temperature	40 °F
Insulation Type	Fiberglass
Wind Speed	20 MPH
Safety Factor	10%
Heater Attachment	GT-6 Fiberglass Tape

Metallic Pipe Applications* include Carbon Steel, Stainless Steel and Copper pipe.

Non-Metallic Pipe Applications* include FRP, PVC, CPVC, HDPE, ABS and Polypropylene.

The information in the tables below represents the wattage of cable necessary to meet the Design Conditions. CLT3 = 3, CLT5 = 5, CLT8 = 8. If a single pass of cable does not satisfy the heat loss requirement, then multiple passes are shown. Example: 5(2) (two passes of 5 watt product).

Metallic Pipe Applications *

	-40°F	86	115	173	173	231	346	461

Notes:

- Maximum segment length is the maximum continuous heater run with minimal voltage drop. For breaker loading, multiple heater segments can be installed in parallel providing no individual length is longer than the maximum published segment length. For voltages other than 240VAC, multiply the amps/foot value in the table above by the power adjustment value below, then divide full breaker amperage rating by the adjusted value to determine maximum total footage allowed.
- Circuit breakers are sized per Article 427-4 of the 1999 National Electrical Code.
- Article 427-22 of the National Electrical Code requires ground-fault equipment protection for each branch circuit supplying electric heating equipment. Electrical connections should be made by a licensed electrician.
- Cable Selection Tables are designed for product selection over a wide range of piping materials. For specific applications utilizing heat transfer aids, such as AT-50 aluminum foil tape, consult your Nelson products representative.

Voltage Adjustment:

Use of Type CLT products at other than nominal voltages requires minor adjustments in power and maximum segment lengths.

Total Cable Requirements:

The total cable length for deicing is determined by including all elements of the roof system that need protection. Use the following tables to determine the total length of cable required.

Item	Feet of cable/Ft. Item	Comments
Gutter	1'	1 Trace/6" gutter width
Downspout	2'	Unless downspout is on end of circuit, the cable is looped down and back
Roof Valley	6'	Per Valley
Dormer	1'	1 ft. of cable/foot of dormer perimeter

Cable Footage Required for Roof Overhangs (Feet of Cable per Foot of Roof)			
Eave Overhang	Feet of Cable Loop Height	Shingle Roof	Metal Roof
12"	18"	1'-10"	2'-6"
24"	30"	2'-8"	3'-6"
36"	42"	3'-8"	4'-6"
48"	54"	4'-8"	5'-6"
