Standstill monitor for safe standstill monitoring

### Approvals

	PSWZ X1P
	◆
	◆
	◆

### Unit features

- ▶ Positive-guided relay outputs:
  - 2 safety contacts (N/O), instantaneous
  - 1 auxiliary contact (N/C), instantaneous
- ▶ LED indicator for:
  - Supply voltage
  - Standstill on channel 1/2
  - Switch status
  - Fault signal if simultaneity time is exceeded
- ▶ Semiconductor outputs signal:
  - Error
  - Switch status
- ▶ Semiconductor input for reset function
- ▶ Measuring inputs for single or three-phase motors
- ▶ Measuring voltage selectable
- ▶ Feedback loop
- ▶ Plug-in connection terminals (either spring-loaded terminal or screw terminal)
- ▶ See order reference for unit types

### Unit description

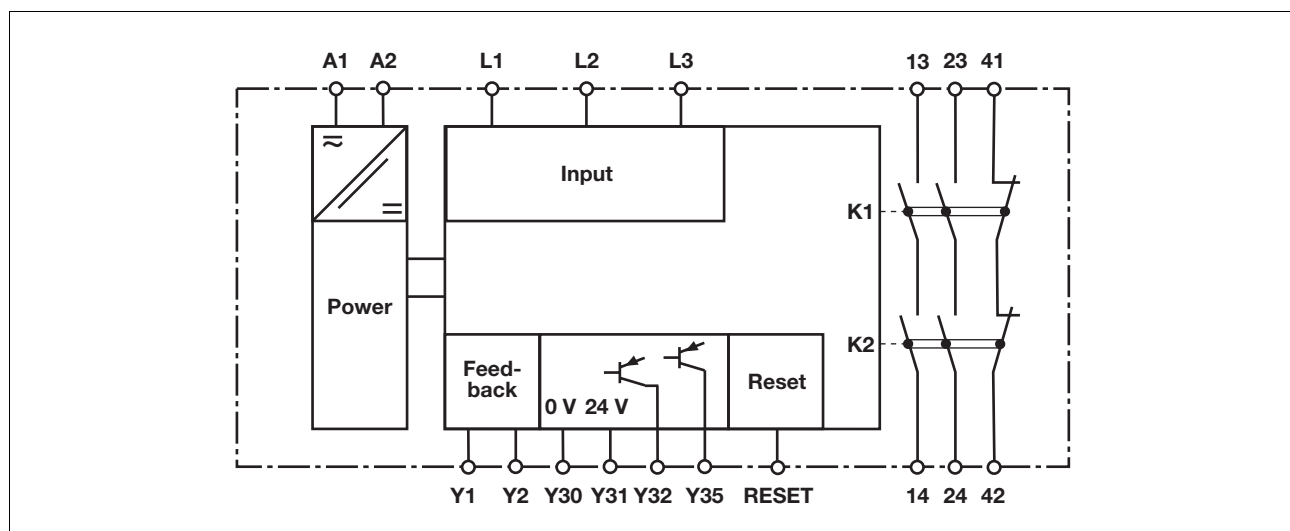

The unit is used for safe standstill monitoring. It is designed for use on

- ▶ Standstill monitoring functions on plants with dangerous machine parts or tools (EN 1088 clause 7.4),
  - ▶ Safety circuits in accordance with EN 60204-1 and IEC 60204-1.
- Standstill is only detected on power-free measuring circuits. Residual voltages, induced voltages or drives with in the position control will prevent safe standstill detection!

### Safety features

- ▶ Relays K1 and K2 are interlocked in such a way that the unit cannot be switched back on in the case of contact welding or an open circuit.
- ▶ The unit monitors the measuring circuits for open circuit. If an open circuit occurs between the unit and the motor or on the motor itself, the unit immediately switches off.
- ▶ The standstill monitor prevents the plant from being enabled in the following cases
  - Power supply failure
  - Component failure
  - Measuring circuits are open circuit
  - Coil defect/open circuit

### Block diagram

## Up to PL e of EN ISO 13849-1 PSWZ X1P

### Function description

The device uses two separate measuring channels to measure the regenerated voltage, induced from the motor during the rundown period or during start-up. If the voltage falls below the set response value (standstill threshold), the standstill monitor enables the monitored plant. If the voltage exceeds the set release value, the standstill monitor disables the monitored plant.

To reactivate, the voltage at both channels must fall below the response value  $U_{on}$  within the time  $t_g$  (simultaneity monitoring). To do this the feedback loop Y1-Y2 must be closed. If the

simultaneity requirement is exceeded, the standstill monitor does not enable the monitored plant. The unit can be reactivated by switching 24 VDC on and off at the RESET input.

The response value  $U_{on}$  can be set jointly for both channels in order to suit the motor that is to be monitored. The release value  $U_{off}$  (hysteresis) corresponds to twice the response value. When used with frequency converters, the PSWZ X1P cannot detect standstill until the controller inhibit has been switched off.

After the supply voltage is switched on, the unit performs a self test. The unit simulates a situation in which the release value is exceeded and the

measuring circuit has an open circuit. The correct function of the output relay and feedback loop is also tested. The test takes ca. 1.5 s.

Operating modes:

- ▶ Single-phase operation:
  - One measuring circuit (calculated at two different measuring points) affects both channels
- ▶ Three-phase operation:
  - Two redundant (identical) measuring circuits affect channel 1 and 2
  - Voltages in the measuring circuit are monitored (failsafe in the event of a short circuit)

### Timing diagram

### Key

- ▶ POWER: Supply voltage
- ▶ UL1/UL2: Input circuit L1, L2, L3
- ▶ Feedback: Feedback loop Y1-Y2
- ▶ Output safe: Safety contacts 13-14, 23-24
- ▶ Output aux: Auxiliary contact 41-42
- ▶ Semi Y35: Semiconductor output for fault signal
- ▶ RESET: Reset input RESET
- ▶  $U_{on}$ : Response value
- ▶  $U_{off}$ : Release value
- ▶  $t_g$ : Simultaneity

### Wiring

Please note:

- ▶ Information given in the "Technical details" must be followed.
- ▶ Outputs 13-14, 23-24 are safety contacts, output 41-42 is an auxiliary contact (e.g. for display).
- ▶ To prevent contact welding, a fuse should be connected before the output contacts (see technical details).
- ▶ Use copper wire that can withstand 60/75 °C.
- ▶ When used with converters: Use screened cable for the wiring between the standstill monitor and the

motor. Connect the cable screening on the motor.

### Terminal configuration

### Installation

- ▶ The safety relay should be installed in a control cabinet with a protection type of at least IP54.
- ▶ Use the notch on the rear of the unit to attach it to a DIN rail.
- ▶ Ensure the unit is mounted securely on a vertical DIN rail (35 mm) by using a fixing element (e.g. retaining bracket or an end angle).

### Dimensions

\* with spring-loaded terminals
