

Description

This system with integrated closing mechanism is used on safety doors or safety enclosures as well as anywhere it is necessary to control access to dangerous areas of machines or systems.

The new safety handle P-KUBE 2, installed in combination with the NG series RFID safety switch with guard locking, provides an integrated locking system for the guards and access control to dangerous areas; this new combination makes it possible to obtain, with a single device, an access control function with the maximum PL e safety level according to EN 13849-1 or SIL 3 according to EN 62061.

Maximum safety with a single device

PL e + SIL 3

The the NG series switches combined with the P-KUBE 2 handle are constructed with redundant electronics. As a result, the maximum PL e and SIL 3 safety levels can still be achieved through the use of a single device on a guard. This avoids expensive wiring in the field and allows faster installation. Inside the control cabinet, the two electronic safety outputs must be connected to a safety module with OSSD inputs or to a safety PLC.

Series connection of several switches

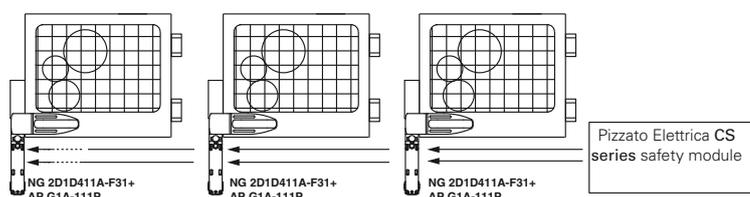

PL e + SIL 3

One of the most important features of the NG series combined with the P-KUBE 2 handle is the possibility of connecting up to 32 sensors in series, while still maintaining the maximum safety levels PL e laid down in EN 13849-1 and SIL 3 acc.

to EN 62061.

This connection type is permissible in safety systems which have a safety module at the end of the chain that monitors the outputs of the last NG switch.

The fact that the PL e safety level can be maintained even with 32 sensors connected in series demonstrates the extremely secure structure of each single device.

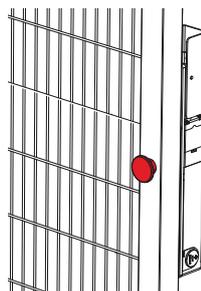

RFID actuators with high coding level

The NG series is provided with an electronic system based on RFID technology to detect the actuator. This allows to provide each actuator with different coding and makes it impossible to tamper with a device by using another actuator of the same series. Millions of different coding combinations are possible for the actuators. They are therefore classified as high level coded actuators, according to EN ISO 14119.

Emergency release button

The release button oriented towards the inside of the machine allows accidentally trapped personnel to escape from the danger area even during a power failure. To reset the switch, simply return the button to its initial position.

The emergency release button can be freely extended using the appropriate extensions, allowing its installation also on very thick jambs (see accessories).

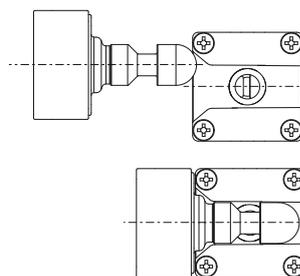

High protection degree

IP69K IP67

These devices are designed to be used in the toughest environmental conditions and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where maximum protection degree of the housing is required. Due to

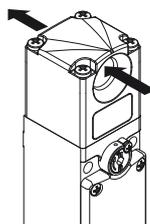

their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and 80°C).

Centring

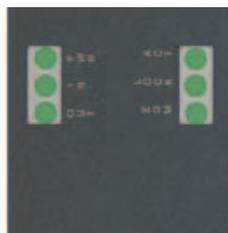

The switch is provided with a wide centring inlet for the actuator pin. This solution makes it easier to align the actuator and the opening hole on the head during installation. Moreover, this solution drastically reduces the probability of a collision between the switch and the actuator, making it possible to install the device even on inaccurately closing doors.

Dustproof

The switch is provided with a through hole for inserting the actuator. Thanks to this unique feature, any dust that enters the actuator hole can always come out on the opposite side instead of remaining inside. Moreover, the lock pin is provided with a diaphragm seal, making the system suitable for critical environments with a high level of dust.

Six LEDs for immediate diagnosis

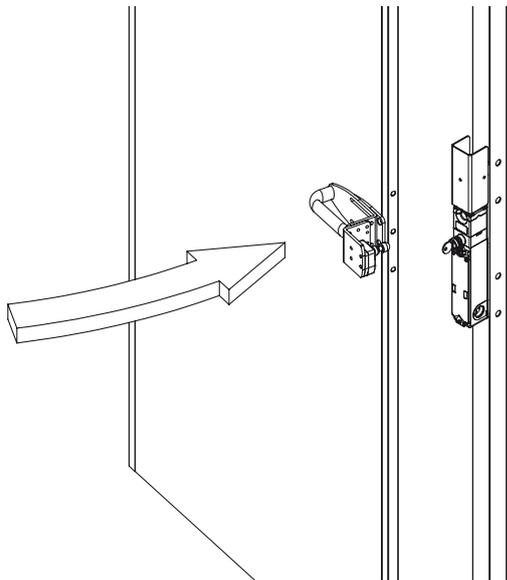

As the LEDs have been designed for quick immediate diagnosis, the status of each input and output is highlighted by one specific LED. This makes it possible to quickly identify the interruption points in the safety chain, which device is released, which door is opened and any errors inside the device. All of this at a glance, without needing to decode complex flashing sequences.

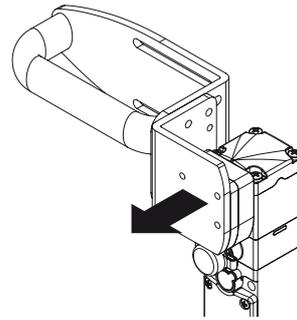

Easy to use

There are no specific sequences required for opening or closing the door, but only a single opening / closing movement.
If the door interlock is realised by means of a handle provided with a release push button, the door can be opened with a single movement even under stress (panic situations).

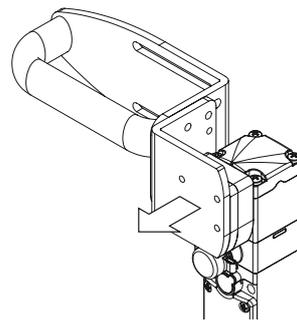

Holding force of the locked actuator

9750 N The robust interlocking system guarantees a maximum actuator holding force of $F_{1max} = 9750$ N. This is one of the highest values currently available on the market today, making this device suitable for heavy-duty applications.

Holding force of the unlocked actuator

The inside of each switch features a device which holds the actuator in its closed position. Ideal for all those applications where several doors are unlocked simultaneously, but only one is actually opened. The device keeps all the unlocked doors in their position with a retaining force of 30 N~, stopping any vibrations or gusts of wind from opening them.

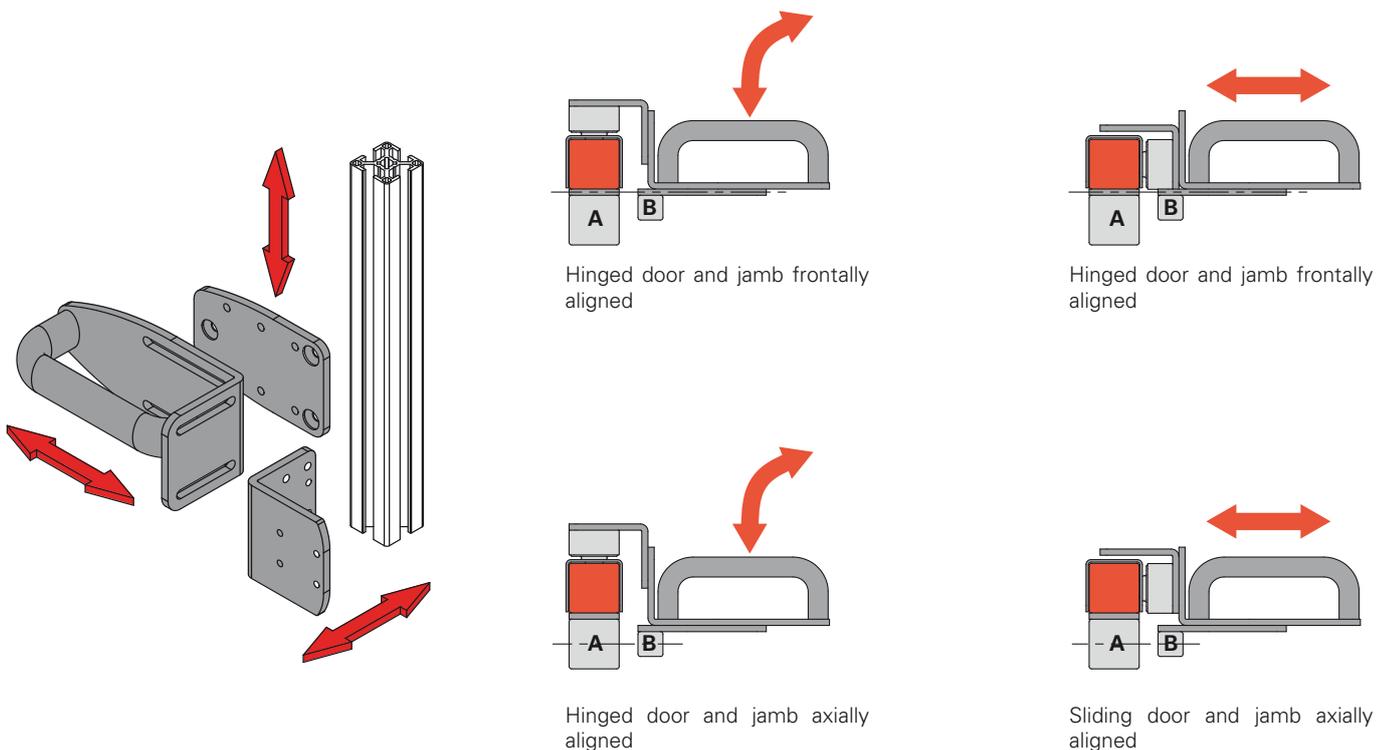

Sturdiness and easy installation

The handle is provided with 5 mm thick sturdy brackets in painted steel. The slots in the brackets allow independent adjustments to be performed. This ensures easy installation, eliminating the need to make changes to structure of the existing guard.

The adjustments make it possible to attach the handle to aluminium profiles or steel frames of various dimensions, from 40x40 mm to 80x80 mm for the frame jamb (A) and from 20x20 mm to 40x40 mm for the door (B).

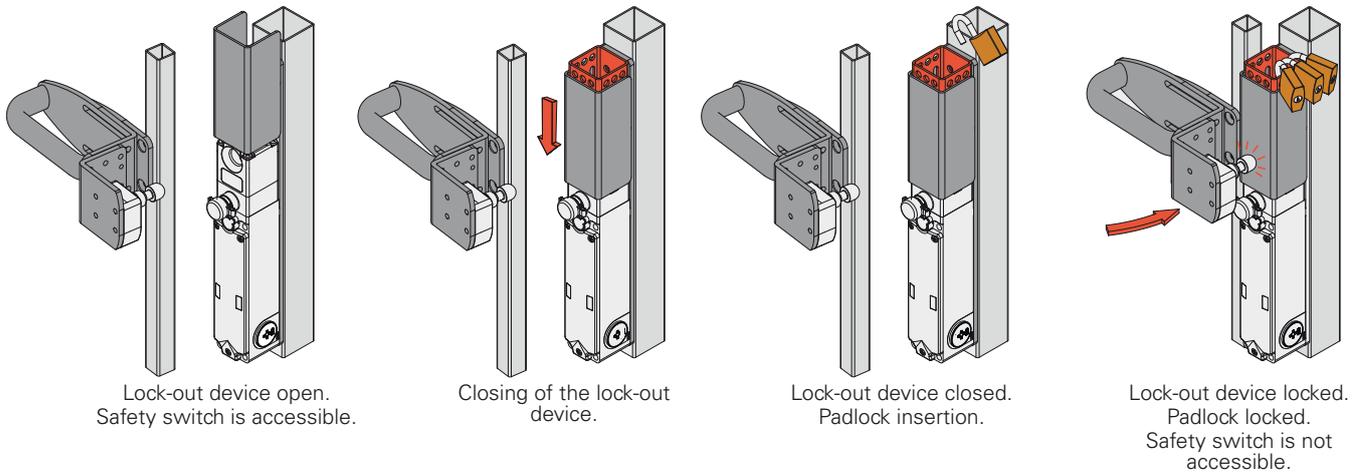

It can be installed both on hinged doors and sliding doors, either with right or left closing.

The handle is supplied with all of the components necessary for fastening at the appropriate distances with tamper-proof screws. The installer only has to assemble the components according to the application, fix the selected switch (supplied separately) and make centring adjustments.

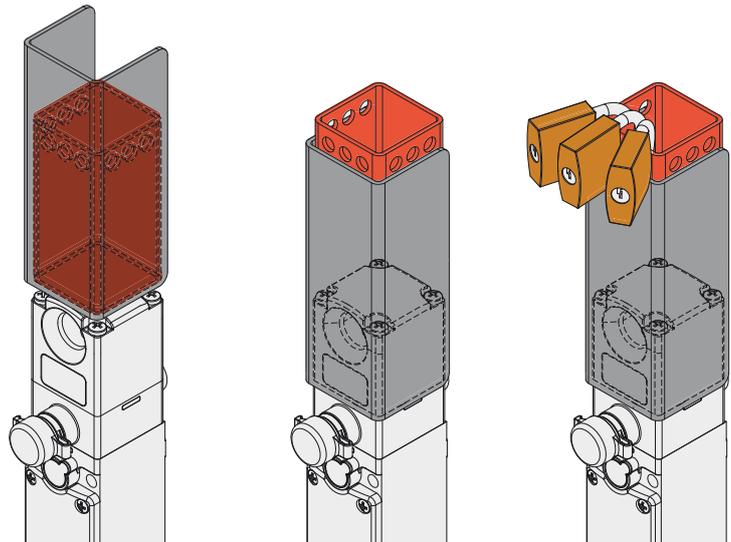

Padlocking option for protecting against errors

The lock-out device is simply pushed downward to expose the holes for mounting padlocks. As a result, padlocks can no longer be mounted incorrectly, since the holes are not exposed until the switch is fully locked. 9 holes for padlocks with a diameter of 7 mm are present. The head of the switch can be quickly rotated in four different directions after loosening the fixing screws, while the lock-out device reliably protects on 3 sides. The lock-out device can thus be used on hinged and sliding doors – with both right and left closing – without any modification.

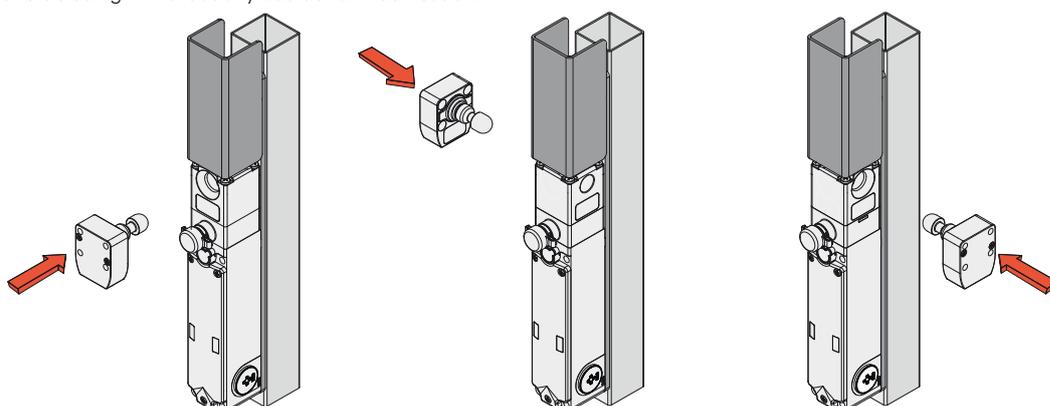

LOCK-OUT: maximum safety with just one movement

With a single operation, the lock-out device can close the centring hole in the NG switch as well as shield the RFID recognition system for detecting the actuator. Accidental closing of the guard is thereby prevented by inhibiting both the mechanical locking of the door and the electrical switching of the switch contacts.

Head rotation

Because the lock-out device covers the switch head in the 3 possible approach directions, it can be used on hinged and sliding doors – with both right and left closing – without any additional modification.

Code structure **Attention!** The feasibility of a code number does not mean the effective availability of a product. Please contact our sales office.

Profiled plate

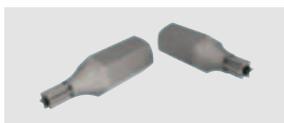

Article	Description
AP A001	Profiled lateral plate

Profiled plate to be installed under the fixing plate of the switch. Suitable for both right and left mounting and provided with holes, this plate can be used for the installation of housings for the EROUND line button panels by Pizzato Elettrica (by means of common self-threading screws available on the market).

Bits for safety screws

Bits for safety screws with pin, with 1/4" hexagonal connection.
