

### POWER SUPPLY

- AC 100-240V Wide-range Input
- Efficiency up to 90%
- Width only 32mm
- 150% Peak Load Capability
- DC Input from 88 to 375Vdc
- Short-term Operation from 60Vac to 300Vac
- Full Power Between -25°C and +60°C
- Quick-connect Spring-clamp Terminals
- 3 Year Warranty

## 1. GENERAL DESCRIPTION

The most outstanding features of this Dimension Q-Series DIN-rail power supply are the high efficiency and the small size, which are achieved by many novel design details. The Q-Series is part of the Dimension family, existing alongside the lower featured C-Series.

With short-term peak power capability of 150% and built-in large sized output capacitors, these features help start motors, charge capacitors and absorb reverse energy and often allow a unit of a lower wattage class to be used.

High immunity to transients and power surges as well as low electromagnetic emission makes usage in nearly every environment possible.

The integrated output power manager, a wide range input voltage design and the low input inrush current make installation and usage simple.

Unique quick-connect spring-clamp terminals allow a safe and fast installation

A large international approval package for a variety of applications makes this unit suitable for nearly every situation.

## 2. SHORT-FORM DATA

|                   |                   |                  |
|-------------------|-------------------|------------------|
| Output voltage    | DC 24V            |                  |
| Adjustment range  | 24-28V            |                  |
| Output current    | 3.4A              | continuous, 24V  |
|                   | 5A                | for typ. 4s, 24V |
| Output power      | 80W               | continuous, 24V  |
|                   | 120W              | for typ. 4s, 24V |
| Output ripple     | < 50mVpp          | 20Hz to 20MHz    |
| Input voltage     | AC 100-240V       | ±15%             |
| Mains frequency   | 50-60Hz           | ±6%              |
| AC Input current  | 1.42 / 0.82A      | at 120 / 230Vac  |
| Power factor      | 0.53 / 0.47       | at 120 / 230Vac  |
| AC Inrush current | typ. 5 / 10A peak | at 120 / 230Vac  |
| DC Input voltage  | DC 110-300V       | -20%/+25%        |
| DC Input current  | 0.8 / 0.29A       | at 110 / 300Vdc  |
| Efficiency        | 88.7 / 90.0%      | at 120 / 230Vac  |
| Losses            | 10.4 / 9.1W       | at 120 / 230Vac  |
| Temperature range | -25°C to +70°C    | operational      |
| Derating          | 2W/°C             | +60 to +70°C     |
| Hold-up time      | typ. 41 / 174ms   | at 120 / 230Vac  |
| Dimensions        | 32x124x102mm      | WxHxD            |

## 3. ORDER NUMBERS

## INTENDED USE

The power supply shall only be installed and put into operation by qualified personnel.

This power supply is designed for installation in an enclosure and is intended for the general use, such as in industrial control, office, communication, and instrumentation equipment. Do not use this device in aircraft, trains and nuclear equipment, where malfunctioning of the power supply may cause severe personal injury or threaten human life.

## TERMINOLOGY AND ABBREVIATIONS

|  |  |
|--|--|
| <b>PE and  symbol</b> | PE is the abbreviation for <b>Protective Earth</b> and has the same meaning as the symbol  .  |
| <b>Earth, Ground</b>   | This document uses the term "earth" which is the same as the U.S. term "ground".   |
| <b>T.b.d.</b>  | To be defined, value or description will follow later.   |
| <b>AC 230V</b>   | A figure displayed with the AC or DC before the value represents a nominal voltage with standard tolerances (usually $\pm 20\%$ ) included.<br>E.g.: DC 12V describes a 12V battery disregarding whether it is full (13.7V) or flat (10V)<br>As long as not otherwise stated, AC 100V and AC 230V parameters are valid at 50Hz and AC 120V parameters are valid at 60Hz mains frequency. |
| <b>230Vac</b>  | A figure with the unit (Vac) at the end is a momentary figure without any additional tolerances included.  |

## DISCLAIMER

The information presented in this document is believed to be accurate and reliable and may change without notice.

### 5. AC-INPUT

|                   |      |             |   |
|-------------------|------|-------------|---|
| AC input          | nom. | AC 100-240V | wide-range input, TN-, TT-, IT-Mains, see Fig. 5-1  |
| AC input range    | min. | 85-276Vac   | continuous operation                                |
|                   | min. | 60-85Vac    | full power for 200ms, no damage between 0 and 85Vac |
|                   | min. | 276-300Vac  | < 500ms   |

### 6. INPUT INRUSH CURRENT

An active inrush limitation circuitry limits the input inrush current after turn-on of the input voltage and after short input voltage interruptions.

The charging current into EMI suppression capacitors is disregarded in the first milliseconds after switch-on.

|                |      | <b>AC 100V</b>       | <b>AC 120V</b>     | <b>AC 230V</b>      |                |

### 7. DC-INPUT

|                   |      |              |                            |
|-------------------|------|--------------|----------------------------|
| DC input          | nom. | DC 110-300V  |                            |
| DC input range    | min. | 88-375Vdc    | continuous operation       |
| DC input current  | typ. | 0.8A / 0.29A | 110Vdc / 300Vdc, 24V, 3.4A |
| Turn-on voltage   | typ. | 61Vdc        | steady state value         |
| Shut-down voltage | typ. | 47Vdc        | steady state value         |

Fig. 7-1 Wiring for DC Input

**Instructions for DC use:**

- Use a battery or similar DC source.
- Connect +pole to L and -pole to N.
- Connect the PE terminal to a earth wire or to the machine ground.

In case the -pole of the battery is not connected to earth, use an appropriate fuse to protect the N terminal.

### 8. OUTPUT

|                          |      |         |  |
|--------------------------|------|---------|--|
| Output voltage           | nom. | 24V     |  |
| Adjustment range         | min. | 24-28V  | guaranteed, multi turn potentiometer       |
|                          | max. | 30V     | at clockwise end position of potentiometer |
| Factory setting          |      | 24.1V   | ±0.2%, at full load, cold unit             |
| Line regulation          | max. | 10mV    | 60 to 300Vac                               |
| Load regulation          | max. | 100mV   | static value, 0A → 3.4A → 0A               |
| Ripple and noise voltage | max. | 50mVpp  | 20Hz to 20MHz, 50Ohm                       |
| Output capacitance       | typ. | 1 500µF |  |

#### Continuous power capability

|                       |      |      |                                      |
|-----------------------|------|------|--------------------------------------|
| Output current        | nom. | 3.4A | at 24V, see Fig. 8-1                 |
|                       | nom. | 3.0A | at 28V, see Fig. 8-1                 |
| Output power          | nom. | 80W  | 24V, continuous                      |
|                       | nom. | 84W  | 28V, continuous                      |
| Short-circuit current | min. | 3.5A | load impedance 250mOhm, see Fig. 8-1 |
|                       | max. | 4.2A | load impedance 250mOhm, see Fig. 8-1 |

#### BonusPower<sup>®</sup>, short term power capability (up to typ. 4s)

The power supply is designed to support loads with a higher short-term power requirement without damage or shutdown. The short-term duration is hardware controlled by an output power manager. The BonusPower<sup>®</sup> is repeatedly available. Detailed information can be found in chapter 26.1 .

Once BonusPower<sup>®</sup> has been stopped by the output power limiter, a timer disables the next BonusPower<sup>®</sup> capability. The recovery timer will start as soon as the output voltage reaches the adjusted value again, which usually happens after the load has been reduced.

|                                       |      |      |  |
|---------------------------------------|------|------|--|
| Output current                        | nom. | 5A   | at 24V, see Fig. 8-1   |
|                                       | nom. | 4.5A | at 28V, see Fig. 8-1   |
| Output power                          | nom. | 120W | 24V, short term  |
|                                       | nom. | 126W | 28V, short term  |
| Short-circuit current                 | min. | 5.2A | load impedance 250mOhm, see Fig. 8-1                             |
|                                       | max. | 6.0A | load impedance 250mOhm, see Fig. 8-1                             |
| Bonus time                            | typ. | 4s   | at 24V, 5A, duration until the output voltage dips, see Fig. 8-2 |
|                                       | min. | 3s   |  |
|                                       | max. | 5s   |  |
| BonusPower <sup>®</sup> recovery time | typ. | 7s   | overload free time to reset power manager, see Fig. 8-3          |

#### Peak current capability (up to several ms)

The power supply can deliver a peak current which is higher than the specified short term current. This helps to start current demanding loads or to safely operate subsequent circuit breakers.

The extra current is supplied by the output capacitors inside the power supply. During this event, the capacitors will be discharged and causes a voltage dip on the output. Detailed curves can be found in chapter 26.2.

|                           |      |                   |                  |
|---------------------------|------|-------------------|------------------|
| Peak current voltage dips | typ. | from 24V to 20V   | at 6.8A for 10ms |
|                           | typ. | from 24V to 12.5V | at 13.5A for 2ms |
|                           | typ. | from 24V to 7.5V  | at 13.5A for 5ms |

### 13. TERMINALS AND WIRING

|                |   |
|----------------|---|
| Type           | Bi-stable, quick-connect spring clamp terminals. IP20 Finger safe construction. Suitable for field- and factory installation. Shipped in open position. |
| Ferrules       | allowed, but not required   |
| Pull-out force | 10AWG:80N, 12AWG:60N, 14AWG:50N, 16AWG:40N (according to UL486E)  |

|                       | Input terminals      | Output terminals       |
|-----------------------|----------------------|------------------------|
| Solid wire            | 0.5-6mm <sup>2</sup> | 0.3-4mm <sup>2</sup>   |
| Stranded wire         | 0.5-4mm <sup>2</sup> | 0.3-2.5mm <sup>2</sup> |
| American wire gauge   | 20-10 AWG            | 26-12 AWG              |
| Wire stripping length | 10mm / 0.4inch       | 6mm / 0.25inch         |

Fig. 13-1 Connecting a wire

#### Instructions:

- Use appropriate copper cables that are designed for an operating temperature of: 60°C for ambient up to 45°C and 75°C for ambient up to 60°C minimum.
- Follow national installation codes and installation regulations!
- Ensure that all strands of a stranded wire enter the terminal connection!
- Up to two stranded wires with the same cross section are permitted in one connection point (except PE wire).
- Do not use the unit without PE connection.

### 14. RELIABILITY

|                          |      | AC 100V         | AC 120V         | AC 230V         |                                     |
|--------------------------|------|-----------------|-----------------|-----------------|-------------------------------------|
| Lifetime expectancy      | min. | 48 000h         | 62 000h         | 79 000h         | 40°C, 24V, 3.4A                     |
|                          | min. | 117 000h        | 126 000h        | 114 000h        | 40°C, 24V, 1.7A                     |
|                          | min. | 136 000h        | 15 years        | 15 years        | 25°C, 24V, 3.4A                     |

|                          |      | <b>812 000h</b> | <b>889 000h</b> | <b>912 000h</b> | 25°C, 24V, 3.4A, Ground Benign GB25 |

The **Lifetime expectancy** shown in the table indicates the operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors.

Lifetime expectancy is specified in operational hours. Lifetime expectancy is calculated according to the capacitor's manufacturer specification. The prediction model allows a calculation of up to 15 years from date of shipment.

**MTBF** stands for **Mean Time Between Failure**, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of the unit to fail and does not necessarily represent the life of a product.

### 15. EMC

The power supply is suitable for applications in industrial environment as well as in residential, commercial and light industry environment without any restrictions. CE mark is in conformance with EMC guideline 89/336/EEC and 93/68/EEC and the low-voltage directive (LVD) 73/23/EWG. A detailed EMC Report is available upon request

| <b>EMC Immunity</b>      | EN 61000-6-1 EN 61000-6-2 |                        | Generic standards |             |
|--------------------------|---------------------------|------------------------|-------------------|-------------|

|                                 | II   | Altitudes from 2000m to 6000m                                     |
| Degree of pollution             | 2  | EN 50178, not conductive  |

Fig. 16-1 Output wattage vs. ambient temp.,

Fig. 16-2 Output wattage vs. altitude

The ambient temperature is defined as the air temperature 2cm below the unit.

### 17. PROTECTION FEATURES

|                                |   |   |
|--------------------------------|---|---|
| Output protection              | Electronically protected against overload, no-load and short-circuits |   |
| Output over-voltage protection | typ. 34Vdc<br>max. 36Vdc  | In case of an internal power supply defect, a redundant circuitry limits the maximum output voltage. The output shuts-down and automatically attempts to restart. |
| Output over-current protection | Electronically limited  | See Fig. 8-1  |
| Degree of protection           | IP 20   | EN/IEC 60529  |
| Penetration protection         | > 3.5mm   | e.g. screws, small parts  |
| Over-temperature protection    | yes   | output shut-down with automatic restart   |
| Input transient protection     | MOV (Metal Oxide Varistor) and active transient filter                |   |
| Internal input fuse            | T6.3A H.B.C.  | not user replaceable  |

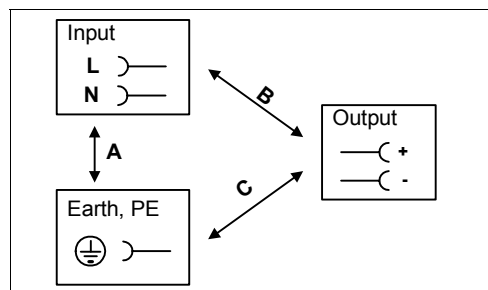

Note: In case of a protection event, audible noise may occur.

### 18. SAFETY

|                                 |   |  |
|---------------------------------|---|--|
| Input / output separation       | SELV<br>PELV<br>double or reinforced insulation                               | IEC/EN 60950-1<br>EN 60204-1, EN 50178, IEC 60364-4-41   |
| Class of protection             | I   | PE (Protective Earth) connection required  |
| Isolation resistance            | > 5M $\Omega$   | input to output, 500Vdc  |
| PE resistance                   | < 0.1 $\Omega$  | between housing and PE terminal  |
| Touch current (leakage current) | typ. 0.11mA<br>typ. 0.15mA<br>typ. 0.25mA<br>< 0.14mA<br>< 0.20mA<br>< 0.35mA | 100Vac, 50Hz, TN mains<br>120Vac, 60Hz, TN mains<br>230Vac, 50Hz, TN mains<br>110Vac, 50Hz, TN mains<br>132Vac, 60Hz, TN mains<br>264Vac, 50Hz, TN mains |

### 19. DIELECTRIC STRENGTH

Fig. 19-1 Dielectric strength

|              |     | A       | B       | C      |
|--------------|-----|---------|---------|--------|
| Type test    | 60s | 2500Vac | 3000Vac | 500Vac |
| Factory test | 5s  | 2500Vac | 2500Vac | 500Vac |
| Field test   | 5s  | 2000Vac | 2000Vac | 500Vac |

**Type tests and factory tests:**

Conducted by the manufacturer. Do not repeat test in field!

**Rules for field test:**

Use appropriate test equipment which applies the voltage with a slow ramp! Connect L and N together as well as all output poles.

The output voltage is floating and has no ohmic connection to ground.

To fulfill the PELV requirements according to EN60204-1 § 6.4.1, we recommend that either the + pole, the – pole or any other part of the output circuit shall be connected to the protective earth system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off any more when unnoticed earth faults occur.

### 20. APPROVALS

### 21. FULFILLED STANDARDS

|                |   |
|----------------|---|
| EN 61558-2-17  | Safety of Power Transformers                |
| EN/IEC 60204-1 | Safety of Electrical Equipment of Machines  |
| EN/IEC 61131-2 | Programmable Controllers                    |
| EN 50178       | Electronic Equipment in Power Installations |

### 22. USED SUBSTANCES

The unit does not release any silicone and is suitable for the use in paint shops.

Electrolytic capacitors included in this unit do not use electrolytes such as Quaternary Ammonium Salt Systems.

Plastic housings and other molded plastic materials are free of halogens, wires and cables are not PVC insulated.

The production material within our production does not include following toxic chemicals:

Polychlorized Biphenyl (PCB), Polychlorized Terphenyl (PCT), Pentachlorophenol (PCP), Polychlorinated naphthalene (PCN), Polybrom Biphenyl (PBB), Polybrom Biphenyl-oxyd (PBO), Polybrominated Diphenylether (PBDE), Polychlorinated Diphenylether (PCDE), Polydibromophenyl Oxyd (PBDO), Cadmium, Asbest, Mercury, Silicia

## 23. PHYSICAL DIMENSIONS AND WEIGHT

|          |   |
|----------|---|
| Weight   | 440g / 0.97lb   |
| DIN-Rail | Use 35mm DIN-rails according to EN 60715 or EN 50022 with a height of 7.5 or 15mm. The DIN-rail height must be added to the depth (102mm) to calculate the total required installation depth. |

Electronic files with mechanical data can be downloaded at [www.pulspower.com](http://www.pulspower.com)

Fig. 23-1 Front view

Fig. 23-2 Side view

## 24. INSTALLATION AND OPERATION INSTRUCTIONS

### Mounting Orientation:

Output terminal must be located on top and input terminal on the bottom. For other orientations see section 26.14.

### Cooling:

Convection cooled, no forced cooling required. Do not cover ventilation grid (e.g. cable conduits) by more than 30%!

### Installation clearances:

40mm on top, 20mm on the bottom, 5mm on the left and right side are recommended when loaded permanently with full power. In case the adjacent device is a heat source, 15mm clearance is recommended.

### Risk of electrical shock, fire, personal injury or death!

Do not use the unit without proper earth connection (Protective Earth). Use the pin on the terminal block for earth connection and not one of the screws on the housing.

Turn power off before working on the power supply. Protect against inadvertent re-powering.

Make sure the wiring is correct by following all local and national codes.

Do not open, modify or repair the unit.

Use caution to prevent any foreign objects from entering into the housing.

Do not use in wet locations or in areas where moisture or condensation can be expected.

### Service parts:

The unit does not contain any serviceable parts. The tripping of an internal fuse is caused by an internal defect. If damage or malfunctioning should occur during operation, immediately turn power off and send unit to factory for inspection!

## 25. ACCESSORY

### ZM1.WALL Wall mounting bracket

This bracket is used to mount Dimension units onto a flat surface without utilizing a DIN-Rail. The two aluminum brackets and the black plastic slider of the unit have to be detached, so that the two steel brackets can be mounted.

Fig. 25-1 ZM1.WALL Wall Mounting Bracket

Fig. 25-2 Assembled Wall Mounting Bracket

### ZM11.SIDE Side mounting bracket

This bracket is used to mount Dimension units sideways with or without utilizing a DIN-Rail. The two aluminum brackets and the black plastic slider of the unit have to be detached, so that the steel brackets can be mounted.

For sideways DIN-rail mounting, the removed aluminum brackets and the black plastic slider need to be mounted on the steel bracket.

Fig. 25-3 ZM11.SIDE Side Mounting Bracket

Fig. 25-4 Side Mounting with DIN-rail brackets

## 26. APPLICATION NOTES

### 26.1. REPETITIVE PULSE LOADING

Typically, a load current is not constant. It varies over time. For pulse load compatibility, following rules must be met:

- The pulse power demand must be below 150% of the nominal power.
- The duration of the pulse power must be shorter than the allowed Bonus Time. (see output section)
- The average (R.M.S.) output current must be below the specified continuous output current.  
If the R.M.S. current is higher, the unit might respond with a thermal shut-down after a while. Use the max. duty cycle curve (Fig. 26-2) to check if the average output current is below the nominal current.
- For altitudes higher than 2000m reduce the pulse loading (15W/1000m) or the ambient temperature (5°C/1000m)

Fig. 26-1 Repetitive pulse loads, definitions

- $P_0$**  Base load (W)
- $P_{PEAK}$**  Pulse load (above 100%)
- $T_0$**  Duration between pulses (s)
- $T_{PEAK}$**  Pulse duration (s)

Fig. 26-2 Max. Duty Cycle Curve

$$\text{DutyCycle} = \frac{T_{\text{peak}}}{T_{\text{peak}} + T_0}$$

$$T_0 = \frac{T_{\text{peak}} - (\text{DutyCycle} \times T_{\text{peak}})}{\text{DutyCycle}}$$

#### Utilizing the Max. Duty Cycle Curve:

Example to determine the repetition rate of pulses without dipping of the output voltage:

##### Parameters of application:

Pulse length is  $T_{PEAK} = 1s$

Steady state load  $P_0=120W$   
(= 50% of  $I_{RATED}$ )

Peak load  $P_{PEAK} = 360W$   
(= 150% of  $I_{RATED}$ )

##### Determining the repetition rate:

- make a vertical line at  $P_{PEAK} = 150\%$
- make a horizontal line where the vertical line crosses the  $P_0 = 50\%$  curve
- Read the Max. Duty Cycle from the Duty Cycle-axis (= 0.37)
- Calculate the min. pause (base load) length  $T_0$ :

$$T_0 = \frac{T_{\text{peak}} - (\text{DutyCycle} \times T_{\text{peak}})}{\text{DutyCycle}} = \frac{1s - (0.37 \times 1s)}{0.37} = \underline{1.7s}$$

- Pulse length = 1s, min. pause length = 1.7s
- Max. repetition rate = pulse length + pause length = **2.7s**

#### More examples for pulse load compatibility:

| $P_{PEAK}$ | $P_0$ | $T_{PEAK}$ | $T_0$   |
|------------|-------|------------|---------|
| 120W       | 80W   | 1s         | >25s    |
| 120W       | 0W    | 1s         | >1.3s   |
| 100W       | 40W   | 1s         | > 0,75s |

| $P_{PEAK}$ | $P_0$ | $T_{PEAK}$ | $T_0$  |
|------------|-------|------------|--------|
| 120W       | 40W   | 0.1s       | >0.16s |
| 120W       | 40W   | 1s         | >1.6s  |
| 120W       | 40W   | 3s         | >4.9s  |

### 26.2. PEAK CURRENT CAPABILITY

Solenoids, contactors and pneumatic modules often have a steady state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady state current and usually exceeds the nominal output current (including the Bonus Power®). The same situation applies, when starting a capacitive load.

Branch circuits are often protected with circuit breakers or fuses. In case of a short or an overload in the branch circuit, the fuse needs a certain amount of over-current to trip or to blow. The peak current capability ensures the safe operation of subsequent circuit breakers.

Assuming the input voltage is turned on before such an event, the built-in large sized output capacitors inside the power supply can deliver extra current. Discharging this capacitor causes a voltage dip on the output. The following two examples show typical voltage dips:

Fig. 26-3 Peak load 6.8A for 50ms, typ.

Peak load 6.8A (resistive) for 50ms  
Output voltage dips from 24V to 18.5V.

Fig. 26-4 Peak load 13.5A for 5ms, typ.

Peak load 13.5A (resistive) for 5ms  
Output voltage dips from 24V to 7.5V.

### 26.3. BACK-FEEDING LOADS

Loads such as decelerating motors and inductors can feed voltage back to the power supply. This feature is also called return voltage immunity or resistance against Back- E.M.F. (Electro Magnetic Force).

This power supply is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter, whether the power supply is on or off.

The maximum allowed feed back voltage is 35Vdc. The absorbing energy can be calculated according to the built-in large sized output capacitor which is specified in chapter 8.

### 26.4. CHARGING OF BATTERIES

The power supply can be used for float-charging of lead-acid or maintenance free 24V VRLA batteries.

**Instructions for charging batteries:**

- a) Set the output voltage, at disconnected load, very precisely to the end-of-charge voltage according to the expected battery temperature.

|                       |       |       |        |       |
|-----------------------|-------|-------|--------|-------|
| End-of-charge voltage | 27.8V | 27.5V | 27.15V | 26.8V |
| Battery temperature   | 10°C  | 20°C  | 30°C   | 40°C  |

- b) Use a 15A or 16A circuit breaker (or blocking diode ) between the power supply and the battery.
- c) Ensure that the output current of the power supply is below the allowed charging current of the battery.
- d) Use only matched batteries when putting 12V types in series.
- e) The return current to the power supply is typ. 6.3mA at 25Vdc when the power supply is switched off (except in case a blocking diode is utilized).

### 26.5. OUTPUT CIRCUIT BREAKERS

Standard miniature circuit breakers (MCBs) can be used for branch protection. Ensure that the MCB is rated for DC voltage, too. The following tests show which circuit breakers the power supply typically trips.

Circuit breakers have huge tolerances in their tripping behavior. Therefore, these typical tests can only be used as a recommendation or for comparing two different power supplies. Furthermore, the loop impedance has a major influence on whether a breaker trips or not. Two tests were performed, representing typical situations:

**Test 1:** Short circuit with S1 on the power supply end of the cable (loop impedance approx. 20mOhm)

Fig. 26-5 Branch protectors, test circuit 1

Parameters:

Input voltage: 230Vac, load current: 0A  
 Tripping time shorter than 5s.

The following circuit breaker tripped during the test:

**A-** or **Z-** Characteristic:: equal or smaller 6A  
**C-** Characteristic: equal or smaller 1A

**Test 2:** Short circuit with S1 on the load end (additional impedance included; represents longer load wire length).

Fig. 26-6 Branch protectors, test circuit 2

Parameters:

Input voltage: 230Vac, load current: 0A  
 Tripping time shorter than 5s.

The following circuit breaker tripped during the test:

**A-** or **Z-** Characteristic::  $\leq 6A$  and  $R < 180m\Omega$   
**C-** Characteristic:  $\leq 1A$  and  $R < 390m\Omega$

What does this resistance mean in wire length?

|                | 0.5mm <sup>2</sup> | 0.7mm <sup>2</sup> | 1.0mm <sup>2</sup> | 1.5mm <sup>2</sup> | 2.5mm <sup>2</sup> | 4.0mm <sup>2</sup> |
|----------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
| <b>180mOhm</b> | 10.9m              | 15.2m              | 21.7m              | 32.6m              | 54.3m              | 86.9m              |
| <b>220mOhm</b> | 6.1m               | 8.6m               | 12.3m              | 18.4m              | 30.6m              | 49.0m              |

**Example:**

Which wire gauge must be used to trip a Z-Characteristic circuit breaker with a rating of 6A? The load wire length is 21m.

Answer: A 6A Z-Characteristic circuit breaker requires a loop impedance of less than 180mOhm (test results). The wire length table shows that up to 25.1m wire with a cross section of 2.5mm<sup>2</sup> are below 180mOhm. A wire not smaller than 2.5mm<sup>2</sup> shall be used.

### 26.6. EXTERNAL INPUT PROTECTION

The unit is tested and approved for branch circuits up to 20A. External protection is only required, if the supplying branch has an ampacity greater than this. In some countries local regulations might apply. Check also local codes and local requirements.

If an external fuse is necessary or utilized, a minimum value is required to avoid undesired tripping of the fuse.

|          |      | B-Characteristic | C-Characteristic |
|----------|------|------------------|------------------|
| Ampacity | max. | 20A              | 20A              |
|          | min. | 6A               | 6A               |

### 26.7. PARALLEL USE TO INCREASE OUTPUT POWER

Power supplies can be paralleled to increase the output power.

Fig. 26-7 Schematic for parallel operation

#### Instructions for parallel use:

- Use only power supplies from the same series (Q-Series).
- A fuse (or diode) on the output is only required if more than three units are connected in parallel.
- Do not load terminals with more than 25A. Follow wiring instructions according to chapter 0
- Keep an installation clearance of 15mm (left/right) between two power supplies and avoid installing the power supplies on top of each other.

### 26.8. PARALLEL USE FOR REDUNDANCY

Power supplies can be paralleled for 1+1 redundancy to gain a higher system availability. Redundant systems require a certain amount of extra power to support the load in case one power supply unit fails. The simplest way is to put two QS3.241 power supplies in parallel. In case one power supply unit fails, the other one is automatically able to support the load current without any interruption. This simple way to build a redundant system has two major disadvantages:

- The faulty power supply can not be recognized. The green LED will still be on since it is reverse-powered from the other power supply.
- It does not cover failures such as an internal short circuit in the secondary side of the power supply. In such a - virtually nearly impossible - case, the defective unit becomes a load for the other power supplies and the output voltage can not be maintained any more.

This can only be avoided by utilizing decoupling diodes which are included in the decoupling module YR2.DIODE or redundancy module YRM2.DIODE with alarm contacts.

Recommendations for building redundant power systems:

- Use separate input fuses for each power supply.
- Monitor the individual power supply units. A DC-ok lamp and a DC-ok contact is included in the redundancy module YRM2.DIODE. This feature reports a faulty unit.
- When possible, connect each power supply to different phases or circuits.

### 26.9. DAISY CHAINING OF OUTPUTS

Daisy chaining (jumping from one power supply output to the next) is allowed as long as the maximum current through one terminal pin does not exceed 25A. If the current is higher, use a separate distribution terminal block.

Fig. 26-8 Daisy chaining of outputs

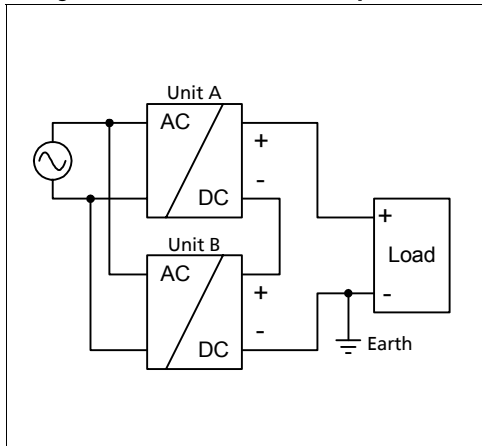

Fig. 26-9 Using distribution terminals

### 26.10. SERIES OPERATION

The power supply can be put in series to increase the output voltage.

Fig. 26-10 Schematic for series operation

#### Instructions for use in series:

- b) It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150Vdc.
- c) Voltages with a potential above 60Vdc are not SELV any more and can be dangerous. Such voltages must be installed with a protection against touching.
- d) For serial operation use power supplies of the same type.
- e) Earthing of the output is required when the sum of the output voltage is above 60Vdc.
- f) Keep an installation clearance of 15mm (left/right) between two power supplies and avoid installing the power supplies on top of each other.

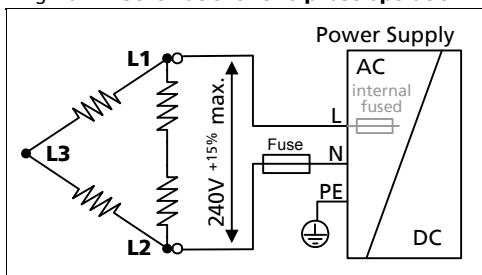

Note: Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals.

### 26.11. INDUCTIVE AND CAPACITIVE LOADS

The unit is designed to supply any kind of load, including unlimited capacitive and inductive loads.

### 26.12. OPERATION ON TWO PHASES

Fig. 26-11 Schematic for two phase operation

#### Instructions for two phase operation:

- a) A phase to phase connection is allowed as long as the supplying voltage is below  $240V^{+15\%}$ .
- b) Use a fuse or a circuit breaker to protect the N input. The N input is internally not protected and is in this case connected to a hot wire.

Appropriate fuses or circuit breakers are specified in section 26.6 "External Input Protection".

### 26.13. USE IN A TIGHTLY SEALED ENCLOSURE

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. The inside temperature defines the ambient temperature for the power supply.

Results from such an installation:

Power supply is placed in the middle of the box, no other heat producer inside the box

|                                |   |
|--------------------------------|---|
| Enclosure:                     | Rittal Typ IP66 Box PK 9516 100, plastic, 110x180x165mm                             |
| Load:                          | 24V, 3.4A; (=100%) load is placed outside the box                                   |
| Input:                         | 230Vac  |
| Temperature inside enclosure:  | 41.3°C (in the middle of the right side of the power supply with a distance of 2cm) |
| Temperature outside enclosure: | 25.1°C  |
| Temperature rise:              | 16.2K   |

## 26.14. MOUNTING ORIENTATIONS

Mounting orientations other than input terminals on the bottom and output on the top require a reduction in continuous output power or a limitation in the max. allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

**Curve A1** Recommended output current.

**Curve A2** Max allowed output current (results approx. in half the lifetime expectancy of A1).

Fig. 26-12  
**Mounting Orientation A**  
Standard Orientation

Fig. 26-13  
**Mounting Orientation B**  
(Upside down)

Fig. 26-14  
**Mounting Orientation C**  
(Table-top mounting)

Fig. 26-15  
**Mounting Orientation D**  
(Horizontal cw)

Fig. 26-16  
**Mounting Orientation E**  
(Horizontal ccw)
