## Redundancy Power Supply

- AC 100-240V Wide-range Input
- Width only 39 mm
- Built-in Decoupling Mosfet for $1+1$ and $n+1$ Redundancy
- Efficiency up to $94.7 \%$
- 20\% Output Power Reserves
- Safe Hiccup PLUS Overload Mode
- Easy Fuse Breaking - 3 times nominal current for 12 ms
- Active Power Factor Correction (PFC)
- Minimal Inrush Current Surge
- Full Power Between $-25^{\circ} \mathrm{C}$ and $+60^{\circ} \mathrm{C}$
- DC-OK Relay Contact
- Current Sharing Feature Included
- 3 Year Warranty

## General Description

The Dimension CP-Series are cost optimized power supplies without compromising quality, reliability and performance. The most outstanding features of the CP10.241-R1/-R2/-R3 units are the high efficiency, electronic inrush current limitation, active PFC, wide operational temperature range and the extraordinary small size. The units include a decoupling MOSFET for building $1+1$ or $n+1$ redundant power supply systems.
These redundancy power supplies come with three connection terminal options; screw terminals, springclamp terminals or plug connector terminals which allows replacement on an active application.
CP10.242-R2 version feature an enhanced DC input voltage range.
With high immunity to transients and power surges, low electromagnetic emission, a DC-OK signal contact for remote monitoring, and a large international approval package, makes this unit suitable for nearly every application.

## Order Numbers

Power Supplies
CP10.241-R1
With quick-connect spring-clamp terminals
CP10.241-R2 With hot swappable plug
CP10.241-R3 With screw terminals
CP10.242-R2 Enhanced DC-Input
Mechanical Accessory
ZM4.WALL Wall/panel mount bracket
ZM12.SIDE Side mount bracket

Short-form Data

| Output voltage | DC 24 V | 0\%/+6\% |
| :---: | :---: | :---: |
| Adjustment range | - |  |
| Output current | 12A | Below $+45^{\circ} \mathrm{C}$ ambient |
|  | 10A | At $+60^{\circ} \mathrm{C}$ ambient |
|  | 7.5A | At $+70^{\circ} \mathrm{C}$ ambient |
|  | Derate linearely between $+45^{\circ} \mathrm{C}$ and $+70^{\circ} \mathrm{C}$ |  |
| AC Input voltage | AC 100-240V | -15\%/+10\% |
| Mains frequency | $50-60 \mathrm{~Hz}$ | $\pm 6 \%$ |
| AC Input current | 2.17 / 1.14A | At 120 / 230Vac |
| Power factor | 0.99 / 0.97 | At 120 / 230Vac |
| Input voltage DC | DC 110-150V ${ }^{ \pm 20 \%}$ | For CP10.241-Rx |
|  | DC 110-300V ${ }^{ \pm 20 \%}$ | For CP10.242-R2 |
| Input current DC | 2.35A / 0.84A | At $110 / 300 \mathrm{Vdc}$ |
| AC Inrush current | 6 / 9Apk | At $120 / 230 \mathrm{Vac}$ |
| Efficiency | 93.0 / 94.7\% | At 120 / 230Vac |
| Losses | 18.1 / 13.4W | At $120 / 230 \mathrm{Vac}$ |
| Hold-up time | $37 / 37 \mathrm{~ms}$ | At $120 / 230 \mathrm{Vac}$ |
| Temperature range | $-25^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ |  |
| Size (wxh x d) | $39 \times 124 \times 117 \mathrm{~mm}$ | Without DIN-rail and plug connectors |

Weight $\quad 600 \mathrm{~g} / 1.32 \mathrm{lb}$

## MARKINGS

For details or a complete approval list see section 20.

## Terminology and Abreviations

PE and ${ }^{()}$symbol
Earth, Ground
T.B.D.

AC 230V

230Vac
$\mathbf{5 0 H z}$ vs. 60 Hz
may
shall
should
1+1 Redundancy

## $\mathbf{N + 1}$ Redundancy

PE is the abbreviation for Protective Earth and has the same meaning as the symbol $\mathcal{\Theta}$. This document uses the term "earth" which is the same as the U.S. term "ground". To be defined, value or description will follow later.
A figure displayed with the AC or DC before the value represents a nominal voltage with standard tolerances (usually $\pm 15 \%$ ) included. E.g.: DC 12 V describes a 12 V battery disregarding whether it is full ( 13.7 V ) or flat ( 10 V ) A figure with the unit (Vac) at the end is a momentary figure without any additional tolerances included.
As long as not otherwise stated, AC 230 V parameters are valid at 50 Hz mains frequency.
A key word indicating flexibility of choice with no implied preference.
A key word indicating a mandatory requirement.
A key word indicating flexibility of choice with a strongly preferred implementation.
Use of two identical power supplies in parallel to provide continued operation following most failures in a single power supply. The two power supply outputs should be isolated from each other by utilizing diodes or other switching arrangements. E.g. two 10A power supplies are needed to achieve a 10A redundant system.
Use of three or more identical power supplies in parallel to provide continued operation following most failures in a single power supply. All power supply outputs should be isolated from each other by utilizing diodes or other switching arrangements.

E.g.: To achieve a 40A redundant system, five 10A power supplies are needed in a N+1 redundant system.

## 1. Intended Use

This device is designed for installation in an enclosure and is intended for the general professional use such as in industrial control, office, communication, and instrumentation equipment.
Do not use this power supply in equipment, where malfunction may cause severe personal injury or threaten human life.

## 2. INSTALLATION REQUIREMENTS

## WARNING Risk of electrical shock, fire, personal injury or death.

- Do not use the power supply without proper grounding (Protective Earth). Use the terminal on the input block for earth connection and not one of the screws on the housing.
- Turn power off before working on the device. Protect against inadvertent re-powering.
- Make sure that the wiring is correct by following all local and national codes.
- Do not modify or repair the unit.
- Do not open the unit as high voltages are present inside.
- Use caution to prevent any foreign objects from entering the housing.
- Do not use in wet locations or in areas where moisture or condensation can be expected.
- Do not touch during power-on, and immediately after power-off. Hot surfaces may cause burns.

## Obey the following installation requirements:

- This device may only be installed and put into operation by qualified personnel.
- Install the device in an enclosure providing protection against electrical, mechanical and fire hazards.
- The device is designed for use in pollution degree 2 areas in controlled environments.
- The enclosure of the device provides a degree of protection of IP20 according to IEC 60529.
- Mount the unit on a DIN-rail so that the input terminals are located on the bottom of the unit. For other mounting orientations see de-rating requirements in this document.
- The device is designed for convection cooling and does not require an external fan. Do not obstruct airflow and do not cover ventilation grid (e.g. cable conduits) by more than $15 \%$ !
- Keep the following installation clearances: 40 mm on top, 20 mm on the bottom, 5 mm on the left and right sides are recommended when the device is loaded permanently with more than $50 \%$ of the rated power. Increase this clearance to 15 mm in case the adjacent device is a heat source (Example: another power supply).
- Make sure that the wiring is correct by following all local and national codes. Use appropriate copper cables that are designed for a minimum operating temperature of $60^{\circ} \mathrm{C}$ for ambient temperatures up to $+45^{\circ} \mathrm{C}, 75^{\circ} \mathrm{C}$ for ambient temperatures up to $+60^{\circ} \mathrm{C}$ and $90^{\circ} \mathrm{C}$ for ambient temperatures up to $+70^{\circ} \mathrm{C}$. Ensure that all strands of a stranded wire enter the terminal connection. Check also local codes and local requirements. In some countries local regulations might apply.
- This device does not contain serviceable parts. The tripping of an internal fuse is caused by an internal defect. If damage or malfunction should occur during installation or operation, immediately turn power off and send the device to the factory for inspection.
- The device is designed, tested and approved for branch circuits up to up to 30 A (UL) or 32 A (IEC) without additional protection device. If an external fuse is utilized, do not use circuit breakers smaller than 10A B- or C-Characteristic to avoid a nuisance tripping of the circuit breaker.
- A disconnecting means shall be provided for the input of the power supply.

## 3. AC-INPUT

The device is suitable to be supplied from TN-, TT- and IT mains networks with AC voltage. For suitable DC supply voltages see chapter 4.

| AC input | Nom. | AC 100-240V |  |
| :--- | :--- | :--- | :--- |
| AC input range | Min. | $85-264 \mathrm{Vac}$ | Continuous operation |
|  | Min. | $264-300 \mathrm{Vac}$ | For maximal 500ms (occasional) |
| Allowed voltage L or N to earth | Max. | 300 Vac | Continuous, according to IEC 60664-1 |
| Input frequency | Nom. | $50-60 \mathrm{~Hz}$ | $\pm 6 \%$ |
| Turn-on voltage | Typ. | 80 Vac | Steady-state value, see Fig. 3-1 |
| Shut-down voltage | Typ. | 70 Vac | Steady-state value, see Fig. 3-1 |
|  | Typ. | 55 Vac | Dynamic value (max. 250ms) |

External input protection See recommendations in chapter 2.

|  | AC 100V |  | AC 120V | AC 230V |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Input current | Typ. | 2.63A | 2.17A | 1.14A | At 10A, see Fig. 3-3 |
| Power factor | Typ. | 0.99 | 0.99 | 0.97 | At 10A, see Fig. 3-4 |
| Crest factor | Typ. | 1.5 | 1.5 | 1.65 | At 10A, The crest factor is the mathematical ratio of the peak value to RMS value of the input current waveform. |
| Start-up delay | Typ. | 300 ms | 290ms | 240 ms | See Fig. 3-2 |
| Rise time | Typ. | 30 ms | 30 ms | 30 ms | At 10A const. current load, 0 mF load capacitance, see Fig. 3-2 |
|  | Typ. | 75 ms | 75ms | 75 ms | At 10A const. current load, 20 mF load capacitance,, see Fig. 3-2 |
| Turn-on overshoot | Max. | 200 mV | 200 mV | 200 mV | See Fig. 3-2 |

Fig. 3-3 Input current vs. output current

Fig. 3-2 Turn-on behavior, definitions

Fig. 3-4 Power factor vs. output current

Feb. 2018 / CP10.241-R2 Rev0.3-EN - All values are typical figures specified at $230 \mathrm{Vac}, 50 \mathrm{~Hz}$ input voltage, 24 V , 10 A output load, $25^{\circ} \mathrm{C}$ ambient and after a 5 minutes run-in time unless otherwise noted.

## 4. DC-InPuT

The device is suitable to be supplied from a DC input voltage. Use a battery or a similar DC source. A supply from the intermediate DC-bus of a frequency converter is not recommended and can cause a malfunction or damage the unit. Connect + pole to L , -pole to N and the PE terminal to an earth wire or to the machine ground.

| DC input | Nom. | DC 110-150V | $\pm 20 \%$ for CP10.241-Rx |
| :---: | :---: | :---: | :---: |
|  | Nom. | DC 110-300V | $\pm 20 \%$ for CP10.242-R2 |
| DC input range | Min. | $88-180 \mathrm{Vdc}$ | Continuous operation for CP10.241-Rx |
|  |  | $88-360 \mathrm{Vdc}$ | Continuous operation for CP10.242-R2 |
| DC input current | Typ. | 2.35A | At 110 Vdc and 10A load current |
|  | Typ. | 0.84A | At 300Vdc and 10A load current |
| Allowed Voltage (+) or (-) input to Earth | Max. | 360 Vdc | Continuous according to IEC 60664-1 |
| Turn-on voltage | Typ. | 80 Vdc | Steady state value |
| Shut-down voltage | Typ. | 70 Vdc | Steady state value |
|  | Typ. | 55 Vdc | Dynamic value (max. 250ms) |

Fig. 4-1 Wiring for DC Input

## 5. Input Inrush Current

An active inrush limitation circuit (NTCs, which are bypassed by a relay contact) limits the input inrush current after turn-on of the input voltage.
The charging current into EMI suppression capacitors is disregarded in the first microseconds after switch-on.

|  |  | AC 100V | AC 120V | AC 230V |  |
| :--- | :---: | :---: | :---: | :---: | :--- |
| Inrush current | Max. | $11 A_{\text {peak }}$ | $7 A_{\text {peak }}$ | $11 A_{\text {peak }}$ | At $40^{\circ} \mathrm{C}$, cold start |
|  | Typ. | $9 A_{\text {peak }}$ | $6 A_{\text {peak }}$ | $6 A_{\text {peak }}$ | At $25^{\circ} \mathrm{C}$, cold start |
|  | Typ. | $9 A_{\text {peak }}$ | $6 A_{\text {peak }}$ | $9 A_{\text {peak }}$ | At $40^{\circ} \mathrm{C}$, cold start |
| Inrush energy | Max. | $0.1 \mathrm{~A}^{2} \mathrm{~s}$ | $0.1 \mathrm{~A}^{2} \mathrm{~s}$ | $0.4 \mathrm{~A}^{2} \mathrm{~s}$ | $\mathrm{At} 40^{\circ} \mathrm{C}$, cold start |

## 6. OUTPUT

The output provides a SELV/PELV/ES1 rated voltage, which is galvanically isolated from the input voltage. The output of the devices includes a decoupling MOSFET for building $1+1$ or $n+1$ redundant power supply systems.
The device is designed to supply any kind of loads, including capacitive and inductive loads. If extreme large capacitors, such as EDLCs (electric double layer capacitors or "UltraCaps") with a capacitance larger than 1.5F are connected to the output, the unit might charge the capacitor in the Hiccup ${ }^{P L U S}$ mode.
The device is featured with a "soft output regulation characteristic" in order to achieve current share between multiple devices when they are connected in parallel. The "soft output regulation characteristic" regulates the output voltage in such a manner that the voltage at no load is approx. $4 \%$ higher than at nominal load.

| Output voltage | Nom. | DC 24 V | 23.8-25.2V |
| :---: | :---: | :---: | :---: |
| Adjustment range |  | See chapter 24.2 |  |
| Factory settings | typ. | 24.1V | $\pm 0.2 \%$, at 10 A , cold unit (results to typ. $23.9 \mathrm{~V}^{ \pm 0.2 \%}$ at 12 A and typ. $25.1 \mathrm{~V}^{ \pm 0.2 \%}$ at no load) |
| Line regulation | Max. | 10 mV | $85-300 \mathrm{Vac}$ |
| Load regulation | Typ. | 1000 mV | Static value, $0 \mathrm{~A} \rightarrow$ 10A; see Fig. 6-1 |
| Ripple and noise voltage | Max. | 50 mV pp | 20 Hz to $20 \mathrm{MHz}, 500 \mathrm{hm}$ |
| Output current | Nom. | 12A ${ }^{1)}$ | Below $45^{\circ} \mathrm{C}$ ambient temperature, see Fig. 17-1 |
|  | Nom. | 10A | At $60^{\circ} \mathrm{C}$ ambient temperature, see Fig. 17-1 |
|  | Nom. | 7.5A | At $70^{\circ} \mathrm{C}$ ambient temperature, see Fig. 17-1 |
| Fuse breaking current ${ }^{2)}$ | Typ. | 30A | Up to 12ms once every five seconds, see Fig. 6-3. |
| Overload protection |  | Included | Electronically protected against overload, no-load and short-circuits. In case of a protection event, audible noise may occur. |
| Overload behaviour |  | Continuous current Intermitted current ${ }^{3)}$ | Output voltage $>13 \mathrm{Vdc}$, see Fig. 6-1 <br> Output voltage $<13 \mathrm{Vdc}$, see Fig. 6-1 |
| Overload/ short-circuit current | Max. | 15.5A | Continuous current, see Fig. 6-1 |
|  | Typ. | 14A | Intermitted current peak value for typ. 2s <br> Load impedance 10 mOhm , see Fig. 6-2. <br> Discharge current of output capacitors is not included. |
|  | Max. | 5A | Intermitted current average value (R.M.S.) Load impedance 10 mOhm , see Fig. 6-2. |
| Output capacitance | Typ. | $4400 \mu \mathrm{~F}$ | Included inside the power supply |
| Back-feeding loads | Max. | 35 V | The unit is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter whether the power supply is on or off. The absorbing energy can be calculated according to the built-in large sized output capacitor. |
| 1) This current is also available for temperatures up to $+70^{\circ} \mathrm{C}$ with a duty cycle of $10 \%$ and/ or not longer than 1 minute every 10 minutes. |  |  |  |
| 2) The fuse braking current is an enhanced transient current which helps to start heavy loads or to trip fuses on faulty output branches. The output voltage stays above 20V. See chapter 24.1 for additional measurements. |  |  |  |
| 3) At heavy overloads (when output voltage falls below 13V), the power supply delivers continuous output current for 2 s. After this, the output is switched off for approx. 18s before a new start attempt is automatically performed. This cycle is repeated as long as the overload exists. If the overload has been cleared, the device will operate normally. See Fig. 6-2. |  |  |  |

Fig. 6-1 Output voltage vs. output current, typ.

Fig. 6-2 Short-circuit on output, Hiccup ${ }^{\text {PLUS }}$ mode, typ.

Fig. 6-3 Dynamic overcurrent capability, typ.

7. Hold-up Time

|  | AC 100V |  |  |  | AC 120V |
| :--- | :--- | :---: | :---: | :---: | :--- |
| Hold-up Time | AC 230V |  |  |  |  |
|  | Typ. | 73 ms | 73 ms | 73 ms | At 5A, see Fig. 7-1 |
|  | Min. | 55 ms | 55 ms | 55 ms | At 5A, see Fig. 7-1 |
|  | Typ. | 37 ms | 37 ms | 37 ms | At 10A, see Fig. 7-1 |
|  | Min. | 28 ms | 28 ms | 28 ms | At 10A, see Fig. 7-1 |

Fig. 7-1 Hold-up time vs. input voltage

Fig. 7-2 Shut-down behavior, definitions

## 8. DC-OK Relay Contact

This feature monitors the output voltage of the power supply in front of the decoupling device (see also chapter 12).

| Contact closes | As soon as the output voltage reaches typically 22Vdc. |
| :--- | :--- |
| Contact opens | As soon as the output voltage dips below 22 Vdc. <br> Short dips will be extended to a signal length of 100 ms . Dips shorter than 1 ms will be ignored. |
| Switching hysteresis | 1 V |
| Contact ratings | Maximal $60 \mathrm{Vdc} 0.3 \mathrm{~A}, 30 \mathrm{Vdc} 1 \mathrm{~A}, 30 \mathrm{Vac} 0.5 \mathrm{~A}$, resistive load <br>  <br> Minimal permissible load: 1 mA at 5 Vdc |
| Isolation voltage | See dielectric strength table in chapter 19. |

## Fig. 8-1 DC-ok relay contact behavior

## 9. Efficiency and Power Losses

|  |  | AC 100V | AC 120V | AC 230V |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Efficiency | Typ. | 92.2\% | 93.0\% | 94.7\% | At 10A |
|  | Typ. | 91.9\% | 92.8\% | 94.6\% | At 12A (Power Boost) |
| Average efficiency*) | Typ. | 91.8\% | 92.4\% | 93.9\% | At $25 \%$ at $2.5 \mathrm{~A}, 25 \%$ at 5 A , $25 \%$ at 7.5A. 25\% at 10A |
| Power losses | Typ. | 4W | 3.7W | 2.9W | At 0A |
|  | Typ. | 11.3 W | 10.7W | 8.6W | At 5A |
|  | Typ. | 20.3W | 18.1W | 13.4W | At 10A |
|  | Typ. | 25.4W | 22.3W | 16.4W | At 12A (Power Boost) |

*) The average efficiency is an assumption for a typical application where the power supply is loaded with $25 \%$ of the nominal load for $25 \%$ of the time, $50 \%$ of the nominal load for another $25 \%$ of the time, $75 \%$ of the nominal load for another $25 \%$ of the time and with $100 \%$ of the nominal load for the rest of the time.

Fig. 9-3 Efficiency vs. input voltage at 10A, typ.

Fig. 9-2 Losses vs. output current, typ.

Fig. 9-4 Losses vs. input voltage at 10A, typ.

## 10. LIfetime Expectancy

The Lifetime expectancy shown in the table indicates the minimum operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors. Lifetime expectancy is specified in operational hours and is calculated according to the capacitor's manufacturer specification. The manufacturer of the electrolytic capacitors only guarantees a maximum life of up to 15 years ( 131400 h ). Any number exceeding this value is a calculated theoretical lifetime which can be used to compare devices.

|  | AC 100V | AC 120V | AC 230V |  |
| :--- | :---: | :---: | :---: | :--- |
| Lifetime expectancy | 143000 h | 153000 h | 188000 h | At 5 A and $40^{\circ} \mathrm{C}$ |
|  | 405000 h | 434000 h | 531000 h | At 5 A and $25^{\circ} \mathrm{C}$ |
|  | 66000 h | 78000 h | 109000 h | At 10 A and $40^{\circ} \mathrm{C}$ |
| 188000 h | 22000 h | 307000 h | At 10 A and $25^{\circ} \mathrm{C}$ |  |
|  | 37000 h | 47000 h | 71000 h | At 12 A and $40^{\circ} \mathrm{C}$ |
|  | 105000 h | 132000 h | 20000 h | At 12 A and $25^{\circ} \mathrm{C}$ |

## 11. MTBF

MTBF stands for Mean Time Between Failure, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product.
The MTBF figure is a statistical representation of the likelihood of a device to fail. A MTBF figure of e.g. 1000 000h means that statistically one unit will fail every 100 hours if 10000 units are installed in the field. However, it can not be determined if the failed unit has been running for 50000 h or only for 100 h .
For these types of units the MTTF (Mean Time To Failure) value is the same value as the MTBF value.

|  | AC 100V | AC 120V | AC 230V |  |
| :---: | :---: | :---: | :---: | :---: |
| MTBF SN 29500, IEC 61709 | 535000 h | 556 000h | 641 000h | At 10 A and $40^{\circ} \mathrm{C}$ |
|  | 972 000h | 1006000 h | 1138000 h | At 10 A and $25^{\circ} \mathrm{C}$ |
| MTBF MIL HDBK 217F | 205 000h | 208 000h | 232 000h | At 10 A and $40^{\circ} \mathrm{C}$; Ground Benign GB40 |
|  | 279 000h | 283000 h | 318 000h | At 10 A and $25^{\circ} \mathrm{C}$; Ground Benign GB25 |
|  | 45000 h | 46 000h | 53 000h | At 10 A and $40^{\circ} \mathrm{C}$; Ground Fixed GF40 |
|  | 58 000h | 59 000h | 63 000h | At 10 A and $25^{\circ} \mathrm{C}$; Ground Fixed GF25 |

## Instructions for wiring:

a) Use appropriate copper cables that are designed for minimum operating temperatures of: $60^{\circ} \mathrm{C}$ for ambient up to $45^{\circ} \mathrm{C}, 75^{\circ} \mathrm{C}$ for ambient up to $60^{\circ} \mathrm{C}$ and $90^{\circ} \mathrm{C}$ for ambient up to $70^{\circ} \mathrm{C}$ minimum.
b) Follow national installation codes and installation regulations!
c) Ensure that all strands of a stranded wire enter the terminal connection!
d) Unused terminal compartments should be securely tightened.
e) Ferrules are allowed and recommended.

## 14. Replacing Units while the System is Running

This feature is available only for the CP10.241-R2 and CP10.242-R2 units, which are equipped with hot-swappable plug connectors.

Fig. 14-1 Replacing the power supply or redundancy module while the system is running

Replacement instructions (Example for left power supply):

- Switch-off circuit breaker (1a).
- Remove plug (2a).
- Remove plug (3a). The plug prevents the cables from shorting.
- Change power supply.
- Put the plug (3a) back in.
- Put the plug (2a) back in.
- Turn-on the circuit breaker (1a).
- The circuit is redundant again.

To replace the right power supply, repeat the process above using (1b), (2b) and (3b).

## 15. Front Side and User Elements

A Input Terminals
$\mathbf{N}, \mathbf{L}$ Line input
()ㅏ) PE (Protective Earth) input

B Output Terminals
$+\quad$ Positive output

- Negative (return) output

C Output voltage potentiometer See chapter 24.2.

D DC-OK LED (green)
On, when the output voltage is above 22 V .

E DC-OK Relay Contact
The DC-OK relay contact is synchronized with the DC-OK LED. See chapter 8 for details.

## 16. EMC

The EMC behavior of the device is designed for applications in industrial environment as well as in residential, commercial and light industry environments.

| EMC Immunity | According to | neric standards EN 61000-6-1 | 1000-6-2 |  |
| :---: | :---: | :---: | :---: | :---: |
| Electrostatic discharge | EN 61000-4-2 | Contact discharge Air discharge | $\begin{aligned} & \hline 8 \mathrm{kV} \\ & 15 \mathrm{kV} \end{aligned}$ | Criterion A Criterion A |
| Electromagnetic RF field | EN 61000-4-3 | $80 \mathrm{MHz}-2.7 \mathrm{GHz}$ | 20V/m | Criterion A |
| Fast transients (Burst) | EN 61000-4-4 | Input lines Output lines DC-OK signal (coupling clamp) | $\begin{aligned} & 4 \mathrm{kV} \\ & 2 \mathrm{kV} \\ & 2 \mathrm{kV} \end{aligned}$ | Criterion A Criterion A Criterion A |
| Surge voltage on input | EN 61000-4-5 | $\begin{aligned} & \mathrm{L} \rightarrow \mathrm{~N} \\ & \mathrm{~L} \rightarrow \mathrm{PE}, \mathrm{~N} \rightarrow \mathrm{PE} \end{aligned}$ | $\begin{aligned} & 2 \mathrm{kV} \\ & 4 \mathrm{kV} \\ & \hline \end{aligned}$ | Criterion A Criterion A |

## 18. Safety and Protection Features

| Isolation resistance | Min. | 500 MOhm | At delivered condition between input and output, measured with 500 Vdc |
| :---: | :---: | :---: | :---: |
|  | Min. | 500MOhm | At delivered condition between input and PE, measured with 500 Vdc |
|  | Min. | 500MOhm | At delivered condition between output and PE, measured with 500 Vdc |
|  | Min. | 500MOhm | At delivered condition between output and DC-OK contacts, measured with 500 Vdc |
| PE resistance | Max. | 0.10hm | Resistance between PE terminal and the housing in the area of the DIN-rail mounting bracket. |
| Output over-voltage protection ${ }^{11}$ | Typ. | 30.5 Vdc |  |
|  | Max. | 32 Vdc |  |
| Class of protection |  | I | According to IEC 61140 |
| Degree of protection |  | IP 20 | According to EN/IEC 60529 |
| Over-temperature protection ${ }^{2)}$ |  | Included | Output shut-down with automatic restart. |
| Input transient protection |  | MOV | (Metal Oxide Varistor) For protection values see chapter 16 (EMC). |
| Internal input fuse |  | Included | Not user replaceable slow-blow high-braking capacity fuse |
| Touch current (leakage current) | Typ. | $0.14 \mathrm{~mA} / 0.36 \mathrm{~mA}$ | At 100Vac, 50 Hz , TN-, TT-mains / IT-mains |
|  | Typ. | $0.20 \mathrm{~mA} / 0.50 \mathrm{~mA}$ | At 120Vac, 60 Hz , TN-,TT-mains / IT-mains |
|  | Typ. | $0.33 \mathrm{~mA} / 0.86 \mathrm{~mA}$ | At $230 \mathrm{Vac}, 50 \mathrm{~Hz}$, TN-, TT-mains / IT-mains |
|  | Max. | $0.18 \mathrm{~mA} / 0.43 \mathrm{~mA}$ | At 110Vac, 50 Hz , TN-, TT-mains / IT-mains |
|  | Max. | $0.26 \mathrm{~mA} / 0.61 \mathrm{~mA}$ | At 132Vac, 60Hz, TN-,TT-mains / IT-mains |
|  | Max. | $0.44 \mathrm{~mA} / 1.05 \mathrm{~mA}$ | At $264 \mathrm{Vac}, 50 \mathrm{~Hz}, \mathrm{TN}$-, TT-mains / IT-mains |

1) In case of an internal defect, a redundant circuit limits the maximum output voltage. The output shuts down and automatically attempts to restart.
2) Temperature sensors are installed on critical components inside the unit and turn the unit off in safety critical situations, which can happen e.g. when ambient temperature is too high, ventilation is obstructed or the de-rating requirements are not followed. There is no correlation between the operating temperature and turn-off temperature since this is dependent on input voltage, load and installation methods.

## 19. DieLectric Strength

The output voltage is floating and has no ohmic connection to the ground. Type and routine tests are conducted by the manufacturer. Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp ( 2 s up and 2 s down). Connect all input-terminals together as well as all output poles before conducting the test. When testing, set the cut-off current settings to the value in the table below.

Fig. 19-1 Dielectric strength

|  |  | A | B | C | D |
| :--- | :--- | :--- | :--- | :---: | :---: |
| Type test | 60 s | 2500 Vac | 4000 Vac | 1000 Vac | 500 Vac |
| Routine test | 5 s | 2500 Vac | 2500 Vac | 500 Vac | 500 Vac |
| Field test | 5 s | 2000 Vac | 2000 Vac | 500 Vac | 500 Vac |
| Cut-off current setting <br> for field test | $>10 \mathrm{~mA}$ | $>10 \mathrm{~mA}$ | $>20 \mathrm{~mA}$ | $>1 \mathrm{~mA}$ |  |

It is recommend that either the + pole, the - pole or any other part of the output circuit shall be connected to the earth/ground system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off when unnoticed earth faults occur.

B*) When testing input to DC-OK ensure that the maximal voltage between DC-OK and the output is not exceeded (column D). We recommend connecting DC-OK pins and the output pins together when performing the test.

## 20. Approvals

| EC Declaration of Conformity | $C E$ | The CE mark indicates conformance with the <br> - EMC directive, <br> - Low-voltage directive and the <br> - ATEX directive (planned) |

## 23. Accessories

### 23.1. ZM4.WALL - WalL/Panel Mount Bracket

This bracket is used to mount the devices on a wall/panel without utilizing a DIN-Rail and can be mounted without detaching the DIN-rail brackets of the power supply.

### 23.2. ZM12.SIDE - Side Mounting Bracket

This bracket is used to mount the power supply sideways with or without utilizing a DIN-Rail. The two aluminum brackets and the black plastic slider of the unit have to be detached, so that the steel brackets can be mounted. For sideway DIN-rail mounting, the removed aluminum brackets and the black plastic slider need to be mounted on the steel bracket.

Fig. 23-7
Side mounting without DIN-
rail brackets

Mounting Dimensions Side mounting bracket

## 24. Application Notes

### 24.1. Peak Current Capability

The unit can deliver peak currents (up to several milliseconds) which are higher than the specified short term currents. This helps to start current demanding loads. Solenoids, contactors and pneumatic modules often have a steady state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady-state current and usually exceeds the nominal output current. The same situation applies when starting a capacitive load. The peak current capability also ensures the safe operation of subsequent circuit breakers of load circuits. The load branches are often individually protected with circuit breakers or fuses. In case of a short or an overload in one branch circuit, the fuse or circuit breaker need a certain amount of over-current to open in a timely manner. This avoids voltage loss in adjacent circuits.
The extra current (peak current) is supplied by the power converter and the built-in large sized output capacitors of the power supply. The capacitors get discharged during such an event, which causes a voltage dip on the output. The following two examples show typical voltage dips for a resistive load:

Fig. 24-1 20A peak current for $\mathbf{5 0 m s}$, typ. ( $2 x$ the nominal current)

Fig. 24-3 30A peak current for $\mathbf{1 2 m s}$, typ. ( $3 x$ the nominal current)

Fig. 24-2 50A peak current for 5ms, typ. (5x the nominal current)

Please note: The DC-OK relay triggers when the voltage dips more than $10 \%$ for longer than 1 ms .

Peak current voltage dips

At 20A for 50 ms , resistive load At 50A for 2 ms , resistive load At 50A for 5 ms , resistive load

### 24.2. Adjusting the Output Voltage

A voltage adjustment potentiometer can be found behind the flap on the front of the unit. However, it is not recommended to change the output voltage since load sharing between power supplies connected in parallel can only be achieved by a precise setting of the output voltages. The factory settings allow precise load sharing and only qualified personnel should change the adjustment potentiometer.

## Lower end of the specified adjustment range

| Output voltage | Nom. | 24.0 V | Due to the soft output voltage regulation characteristic (parallel mode feature) a setting to 24.0 V results to an output voltage of $23.8 \mathrm{~V}^{ \pm 0.2 \%}$ at 12 A and $25.0 \mathrm{~V}^{ \pm 0.2 \%}$ at no load. See Fig. 24-4. |
| :---: | :---: | :---: | :---: |
| Output current | Min. | 12A | At $45^{\circ} \mathrm{C}$ |
|  | Min. | 10A | At $60^{\circ} \mathrm{C}$ |
|  | Min. | 7.55A | At $70^{\circ} \mathrm{C}$ |
|  |  | Reduce output current linearly between $+45^{\circ} \mathrm{C}$ and $+70^{\circ} \mathrm{C}$. |  |
| Upper end of the specified adjustment range |  |  |  |
| Output voltage | Nom. | 27.0 V | Due to the soft output voltage regulation characteristic (parallel mode feature) a setting to 27.0 V results to an output voltage of $26.7 \mathrm{~V}^{ \pm 0.2 \%}$ at 10.6 A and $28.2 \mathrm{~V}^{ \pm 0.2 \%}$ at no load. See Fig. 24-4. |
| Output current | Min. | 10.6A | At $45^{\circ} \mathrm{C}$ |
|  | Min. | 8.9A | At $60^{\circ} \mathrm{C}$ |
|  | Min. | 6.7A | At $70^{\circ} \mathrm{C}$ |
|  |  | Reduce | cut current linearly between $+45^{\circ} \mathrm{C}$ and $+70^{\circ} \mathrm{C}$. |

The maximum output voltage which can occur at the clockwise end position of the potentiometer due to tolerances is 30 V . It is not a guaranteed value which can be achieved.
Current values between 24 and 27V can be interpolated.

Fig. 24-4 Adjustment range of the output
voltage

The output voltage shall only be changed when absolutely necessary, e.g. for battery charging as described in the next chapter.

### 24.3. Charging of Batteries

This redundancy power supply is ideal for charging batteries due to the decoupling circuit built in to the output stage which does not require a fuse or diode between the power supply and the battery.
It can be used to charge sealed lead acid (SLA) or valve regulated lead acid (VRLA) lead batteries when following these instructions:
a) Set output voltage (measured at disconnected battery) very precisely to the end-of-charge voltage. Use the potentiometer, which is hidden behind the flap on the front of the unit. See chapter 24.2.

| Battery temperature | $10^{\circ} \mathrm{C}$ | $20^{\circ} \mathrm{C}$ | $30^{\circ} \mathrm{C}$ | $40^{\circ} \mathrm{C}$ |
| :--- | :--- | :--- | :--- | :--- |
| End-of-charge voltage | 27.8 V | 27.5 V | 27.15 V | 26.8 V |

b) Ensure that the ambient temperature of the power supply stays below $40^{\circ} \mathrm{C}$.
c) Use only matched batteries when connecting 12 V types in series.
d) The return current to the power supply (battery discharge current) is typically 3 mA when the power supply is switched off.

### 24.4. Output Circuit Breakers

Standard miniature circuit breakers (MCB's or UL 1077 circuit breakers) are commonly used for AC-supply systems and may also be used on 24 V branches.
MCB's are designed to protect wires and circuits. If the ampere value and the characteristics of the MCB are adapted to the wire size that is used, the wiring is considered as thermally safe regardless of whether the MCB opens or not.
To avoid voltage dips and under-voltage situations in adjacent 24 V branches which are supplied by the same source, a fast (magnetic) tripping of the MCB is desired. A quick shutdown within 10 ms is necessary corresponding roughly to the ride-through time of PLC's. This requires power supplies with high current reserves and large output capacitors. Furthermore, the impedance of the faulty branch must be sufficiently small in order for the current to actually flow. The best current reserve in the power supply does not help if Ohm's law does not permit current flow. The following table has typical test results showing which B- and C-Characteristic MCBs magnetically trip depending on the wire cross section and wire length.

Fig. 24-5 Test circuit

S1... Fault simulation switch

Maximal wire length*) for a fast (magnetic) tripping:

|  | $0.75 \mathrm{~mm}^{2}$ | $1.0 \mathrm{~mm}^{2}$ | $1.5 \mathrm{~mm}^{2}$ | $2.5 \mathrm{~mm}^{2}$ |
| :---: | :---: | :---: | :---: | :---: |
| C-2A | 30 m | 37 m | 54 m | 84 m |
| C-3A | 25 m | 30 m | 46 m | 69 m |
| C-4A | 9 m | 15 m | 25 m | 34 m |
| C-6A | 3 m | 3 m | 4 m | 7 m |
| C-8A |  |  |  |  |
|  |  |  |  |  |
| B-6A | 12 m | 15 m | 21 m | 34 m |
| B-10A | 3 m | 3 m | 4 m | 9 m |
| B-13A | 2 m | 2 m | 3 m | 6 m |

### 24.5. Series Operation

Power supplies of the same type can be connected in series for higher output voltages. It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150 Vdc . Voltages with a potential above 60 Vdc must be installed with a protection against touching.
Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals.
Keep an installation clearance of 15 mm (left / right) between two power supplies and avoid installing the power supplies on top of each other. Do not use power supplies in series in mounting orientations other than the
 standard mounting orientation (input terminals on bottom of the unit).
Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

### 24.6. Parallel Use to Increase Output Power

Power supplies can be paralleled to increase the output power. For redundancy applications one extra power supply is always needed for sufficient output current in case one unit fails.
The unit is permanently set to "parallel use" mode in order to achieve load sharing between power supplies connected in parallel. The "Parallel use" mode regulates the output voltage in such a manner that the voltage at no load is approx. $4 \%$ higher than at nominal load. See also chapter 6. Energize all units at the same time. It also might be necessary to cycle the input power (turn-off for at least five seconds), if the output was in overload or short circuits and the required output current is higher than
 the current of one unit.
Keep an installation clearance of 15 mm (left / right) between two power supplies and avoid installing the power supplies on top of each other.
Do not use power supplies in parallel in mounting orientations other than the standard mounting orientation (input terminals on bottom of the unit) or in any other condition where a derating of the output current is required (e.g. altitude).
Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies. Do not load paralleled power supplies with higher currents as shown in the following diagrams:

Fig. 24-7 Output current vs. ambient temp. for three paralleled units

### 24.7. Parallel Use for Redundancy

Power supplies can be paralleled for redundancy to gain higher system availability. The unit is already equipped with a MOSFET as decoupling device on the output to avoid, that a faulty unit becomes a load for the other power supplies and the output voltage cannot be maintained any more.
Recommendations for building redundant power systems:
a) Use separate input fuses for each power supply.
b) Monitor the individual power supply units by utilizing the built-in DC-OK relay contacts on each power supply.

Fig. 24-8 Wiring diagram, 1+1 Redundancy for 10A output current

Note: Use separate mains systems for each power supply whenever it is possible

Fig. 24-9 Wiring diagram, N+1 Redundancy for 20A output current

Observe the temperature derating requirements of Fig. 24-6 and Fig. 24-7 for $n+1$ redundancy applications.
Note: Use separate mains systems for each power supply whenever it is possible.

### 24.8. Operation on Two Phases

The power supply can also be used on two-phases of a three-phasesystem. Such a phase-to-phase connection is allowed as long as the supplying voltage is below $240 \mathrm{~V}^{+10 \%}$.
The maximum allowed voltage between a Phase and the PE must be below 300 Vac .

### 24.9. Use in a Tightly Sealed Enclosure

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. In such situations, the inside temperature defines the ambient temperature for the power supply.
The following measurement results can be used as a reference to estimate the temperature rise inside the enclosure. The power supply is placed in the middle of the box, no other heat producing items are inside the box The temperature sensor inside the box is placed in the middle of the right side of the power supply with a distance of 1 cm .

|  | Case A | Case B | Case C | Case D |
| :--- | :--- | :--- | :--- | :--- |
| Enclosure size | $\mathbf{1 1 0 \times 1 8 0 \times 1 6 5 \mathrm { mm }}$ | $\mathbf{1 1 0 \times 1 8 0 \times 1 6 5 \mathrm { mm }}$ | $\mathbf{1 8 0 \times 1 8 0 \times 1 6 5 \mathrm { mm }}$ | $\mathbf{1 8 0 \times 1 8 0 \times 1 6 5 \mathrm { mm }}$ |

|  | PK 9516 100, | PK 9516 100, | PK 9519 100, | PK 9519 100, |
|  | plastic | plastic | plastic | plastic |
| Input voltage | 230 Vac | 230 VaC | 230 Vac | 230 Vac |
| Load | $24 \mathrm{~V}, 8 \mathrm{~A} ;(=\mathbf{8 0 \%})$ | $24 \mathrm{~V}, 10 \mathrm{~A} ;(=\mathbf{1 0 0 \%})$ | $24 \mathrm{~V}, 8 \mathrm{~A} ;(=\mathbf{8 0 \%})$ | $24 \mathrm{~V}, 10 \mathrm{~A} ;(=\mathbf{1 0 0 \%})$ |
| Temperature inside the box | $45.4^{\circ} \mathrm{C}$ | $49.0^{\circ} \mathrm{C}$ | $42.0^{\circ} \mathrm{C}$ | $44.4^{\circ} \mathrm{C}$ |
| Temperature outside the box | $25.0^{\circ} \mathrm{C}$ | $25.0^{\circ} \mathrm{C}$ | $25.0^{\circ} \mathrm{C}$ | $25.0^{\circ} \mathrm{C}$ |
| Temperature rise | 20.4 K | 24.0 K | 17.0 K | 19.4 K |

### 24.10. Mounting Orientations

Mounting orientations other than all terminals on the bottom require a reduction in continuous output power or a limitation in the maximum allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

## Curve A1 Recommended output current.

Curve A2 Max allowed output current (results in approximately half the lifetime expectancy of A1).
