### Description

The TDB Series combines accurate digital circuitry with isolated 10 A rated DPDT or SPDT relay contacts in an 8 or 11 pin plug-in package. The TDB Series features DIP switch selectable time delays ranging from 100 milliseconds to 10,230 seconds in three ranges. The TDB Series is the product of choice for custom control panel and OEM designers.

### Operation

Input voltage must be applied to the input before and during timing. Upon closure of the initiate switch, the output relay is energized. The time delay begins when the initiate switch is opened (trailing edge triggered). The output remains energized during timing. At the end of the time delay, the output de-energizes. The output will energize if the initiate switch is closed when input voltage is applied.

**Reset:** Reclosing the initiate switch during timing resets the time delay. Loss of input voltage resets the time delay and output.

### Function

S1 = Initiate Switch V = Voltage R = Reset  
NO = Normally Open NC = Normally Closed  
TD = Time Delay — = Undefined time

### Connection

8 Pin Octal  
SPDT

11 Pin DPDT

S1 = Initiate Switch

Relay contacts are isolated. Dashed lines are internal connections.
