The Model 102-600 is a voltage monitor designed to protect 3-phase, 475-600VAC, 50/60Hz motors from damage caused by low voltage, voltage unbalance, single phasing, and phase reversal.

A unique microcontroller-based voltage sensing circuit constantly monitors the single-phase voltages to detect harmful power line conditions. When a harmful condition is detected, the 102-600's output relay is deactivated after a fixed trip delay. The output relay reactivates after power line conditions return to an acceptable level and a fixed amount of time has elapsed (restart delay). The trip delay prevents nuisance tripping due to rapidly fluctuating power line conditions.
