

## FDNL-XSG16-T

This station provides a connection for up to sixteen I/O points. There are two I/O points per connector. Each connector can support two inputs or two outputs, or one input and one output. This extremely flexible station can have any mixture of inputs and outputs.

To use an I/O point as an input, simply leave the corresponding output OFF. The I/O point LED will turn green to indicate that the sensor is ON.

To use an I/O point as an output, simply turn on the corresponding output bit. The output will switch high and the I/O LED will turn green. Note that this will in turn cause the corresponding input bit to turn on. If the corresponding input does not turn on, the output is shorted.

Because the inputs and outputs are powered off the same circuit, this station is not recommended for E-stop outputs.

The node address can be set using the rotary switches located under the device cover or through software node commissioning. The unit automatically detects the communication rate.

The FDNL-XSG16-T supports explicit messaging, polled, change of state, and cyclic I/O messages. These connections are established through UCMM or predefined master/ slave connection set.

Recommended Cordsets:

Bus line: RSM RKM 579-\*M

Inputs / Outputs: VBRS 4.4-2RK 4T-\*/\* or RK 4.4T-\*RS 4.4T
