## SAFE RELAY UNIVERSAL SAFETY RELAYS

The safe RELAY safety relays offer customized solutions for the safety of man and machine.

These devices combine excellent technical performance with efficient use in everyday industrial applications. Compact design, flexible use and flexible connection methods are the decisive advantages of these devices.

Depending on the application and the selected device, the safety relays can be used up to PL e / Category 4 (EN ISO 13849-1) or SIL 3 (EN 62061).

## VERSATILE APPLICATION OPTIONS

- Emergency stop monitoring
- Monitoring of protective doors and interlocks
- Light curtain monitoring
- Two-hand relay
- Monitoring of valves and limit value switches
- Safe contact expansions

safe RELAY

## Safety relays

The simple and safe connection
for every situation.

Further informations about the screw terminal set and the push-in terminal set see page 21.

SNA, SNO, SNS, SNT, SNZ

## Basic devices

The basic devices of the SNA, SNO, SNS, SNT and SNZ device families feature a safe internal logic component for the monitoring of the respective safety functions.

## SNV

## Basic devices with time function

The basic devices of the SNV device families feature a safe internal logic component for the monitoring of the respective safety functions.

In addition, these devices offer timedelayed, safe outputs and a corresponding time setting on the device.

## SNE

## Contact expansion relays

The contact expansion relays of the SNE device family feature a redundant internal structure and are used for contact multiplication on, for example, basic devices.

## SNO 4083KM

## MONITORING OF EMERGENCY STOP, SAFETY GATES AND LIGHT BARRIERS

$\Delta$ c UL US CC

## APPLICATIONS

- Protection of people and machinery
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Monitoring of light barriers
- Up to PL e / Categorie 4 (EN ISO 13849-1)
- Up to SILcl 3 (EN 62061)

## FEATURES

- Stop Category 0 according to EN 60204-1
- Single-channel or two-channel control
- Two-channel control with NC/NC or NC/NO
- Manual or automatic start
- SafeStart
- Cross monitoring
- Synchronous time monitoring for two-channel control
- 3 enabling current path / 1 signalling current path
- Universal application - The two-channel control of the device is carried out by either an NC/NC or an NC/NO combination of the safety sensor.
In the case of two-channel control of the device, a synchronous time is automatically monitored between the two channels.
- SafeStart function - When the device is used with a manual start, the reset input is automatically monitored for a rising and falling signal edge.
A manual reset signal is only accepted if the control inputs of the device are activated by the safe transducer (e.g. emergency stop button) during the entire activation procedure.
- Monoflop function - This function is integrated into the device and prevents device interlocking under all circumstances. This is a decisive advantage in applications where very short interruptions of the safety-related signals can occur, or in the case of transducers with bouncing contacts or safe optical sensors (BWS), for example.
- Simple diagnosis - The device features an intelligent display system that shows the user the different operating modes of the device in its different applications. This means, for example, that when the control inputs are closed and manual start has been selected, a reset signal is displayed, which has not yet been given. Fault states in the control (e.g. synchronous time exceeded or a short-circuit in two-channel control) are also signaled to the user via a blinking code.

## SNO 4062K/KM

## MONITORING OF EMERGENCY STOP, SAFETY GATES AND LIGHT BARRIERS

## -(UL) us (CCC

## FUNCTION

## SNO 4062K

The device is a two-channel switching device for emergency stop applications with self-monitoring on each ON-OFF cycle. It complies with EN 60204-1 and is equipped with forcibly guided relays.

## BASIC FUNCTION:

With supply voltage applied to terminals A1/A2 and the safety inputs closed, pressing the reset button closes the enabling current paths (manual start). When the safety inputs are opened/ de-energized the enabling current paths will open.

- Manual start When the safety inputs are closed, a button is used to open reset input S34 (triggering with falling edge) or to close reset input S35 (triggering with rising edge).
- Automatic start Reset input S35 is connected to S33. The device starts with the rising edge of the signal on safety input S12.

## APPLICATIONS

- Protection of people and machinery
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Monitoring of light barriers
- Up to PL e / Category 4 (EN ISO 13849-1)
- Up to SILcl 3 (EN 62061)

## FEATURES

- Stop Category 0 according to EN 60204-1
- Reset button monitoring
- Manual or automatic start

Single-channel or two-channel control

- Cross monitoring
- 2 enabling current paths, 1 signal current path

## SNO 4062KM

The function of this device corresponds to that of the SNO 4062 K without synchrocheck. The device is suitable for connecting to light curtains for Type 4 (EN 61496-1) and connecting to short-circuit forming 4-wire safety mats, switching strips or switching edges (without monitoring resistance).

- Safety mats The device must be operated with two channels and cross monitoring. If there is resistance $<50 \Omega$ / channel and a short circuit between the channels (S11/S12 and S21/S22) the enabling paths open and the SUPPLY LEDs flashes.
- Light curtain for Type 4 (EN 61496-1) The device will be operated with two channels and without cross monitoring, if the light curtain connected to the OSSD detects a shunt fault on its own.

For applications with tactile operating modes (rapid ON-OFF cycles, for example with manual supply) we recommend using SNO 4062KM.

## SNO 4063K/KM

## MONITORING OF EMERGENCY STOP, SAFETY GATES AND LIGHT BARRIERS

## FUNCTION

## SNO 4063K

The device is a two-channel switching device for emergency stop applications with self-monitoring on each ON-OFF cycle. It complies with EN 60204-1 and is equipped with forcibly guided relays.
After supply voltage has been applied to the A1/A2 terminals and the safety inputs have been closed, pressing the reset button closes the enabling current paths (manual start). When the safety inputs are opened/de-energized the enabling current paths will open.

- Manual start When the safety inputs are closed, a button is used to open reset input S34 (triggering with falling edge) or to close reset input S35 (triggering with rising edge).
- Automatic start Reset input S35 is connected to S33. The device starts with the rising edge of the signal on safety input S12.

## APPLICATIONS

- Protection of people and machinery
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Monitoring of light barriers
- Up to PL e / Category 4 (EN ISO 13849-1)
- Up to SIL cl 3 (EN 62061)

## FEATURES

- Stop Category 0 according to EN 60204-1
- Manual or automatic start
- Cross monitoring
- Single-channel or two-channel control
- 3 enabling current paths

## SNO 4063KM

The function of this device corresponds to that of the SNO 4063K. The device is suitable for connecting to light curtains for Type 4 (EN 61496-1) and to short-circuit forming 4-wire safety mats, switching strips or switching edges (without monitoring resistance).

- Safety mats The device must be operated with two channels and cross monitoring. If there is resistance $<50 \Omega /$ channel and a short circuit between the channels (S11/S12 and S21/S22) the enabling paths open and the SUPPLY LEDs flash.
- Light curtain for Type 4 (EN 61496-1) The device will be operated with two channels and without cross monitoring, if the light curtain connected to the OSSD detects a shunt fault on its own.

For applications with tactile operating modes (rapid ON-OFF cycles, for example at manual supply) we recommend the use of SNO 4063KM

## SNA 4043K/KM/KE, SNA 4044K/KM

MONITORING OF EMERGENCY STOP, SAFETY GATES AND LIGHT BARRIERS

## (LO) © ©

## FUNCTION

Emergency stop and safety gate monitor The safety switching devices of our SNA product line are used to monitor safety sensors (emergency stop buttons, safety gate switches, etc.), feature a large number of safety switching contacts (3 NO contacts/1 NC contact or 4 NO contacts) with a total width of only 22.5 mm at a constant current of up to 8 A . They can be implemented in the extended temperature range up to $65^{\circ} \mathrm{C}$.

## APPLICATIONS

- Protection of people and machinery
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Monitoring of light barriers
- Up to PL e / Category 4 (EN ISO 13849-1)
- Up to SIL ${ }_{c l} 3$ (EN 62061)

## FEATURES

- Stop Category 0 according to EN 60204-1
- Single-channel or two-channel control
- Automatic start
- Manual reset without monitoring
- Cross monitoring
- 3 to 4 enabling current paths
- Automatic start - Reset input S34 is connected to safety input S11. To monitor external contact blocks (EDM), their NC contacts must be connected in series between S34 and S11.
- Manual start without monitoring - Reset input S34 is connected to safety input S11 via a RESET button. To monitor external contact blocks (EDM), their NC contacts must be connected to the RESET button in series.
- Monitoring of light curtains - The KM device types are especially suitable for the monitoring of very fast tactile switching operations, for example in safety light curtain applications. Very short switch-off procedures of a few milliseconds are detected reliably and lead to the switching off of the internal relays.

## MONITORING OF EMERGENCY STOP, SAFETY GATES AND LIGHT BARRIERS

## 

## FUNCTION

After the supply voltage is applied to terminals A1/A2 and the safety inputs are closed, the enabling current paths (NO contacts) are closed and the signal current path (NC contact) is opened by pressing the reset button (manual start with monitoring). When the safety inputs are opened/de-energized, the enabling current paths (NO contacts) are opened immediately.

TECHNICAL DATA

## SNO 4003K

## MONITORING OF EMERGENCY STOP AND SAFETY GATES

## ©(1)us © (CC)

## FUNCTION

The device is a single-channel switching device for emergency stop applications with self-monitoring on each ON-OFF cycle. It complies with EN 60204-1 and is equipped with forcibly guided relays.

The device has either two Y2 reset inputs (without reset monitoring) or two Y 3 reset inputs (with reset monitoring). The K1 and K 2 relays are actuated eitherautomatically (bridge Y1 Y2) or after the reset button (on Y1 Y3) has been pressed. They become self-locking through their own contacts, if there is an electrical connection between terminal A1 and the supply voltage (emergency stop button, position switches).

## APPLICATIONS

- Protection of people and machinery
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Up to PL d / Category 3 (EN ISO 13849-1)*
- Up to SILcl 2 (EN 62061)*

## FEATURES

- Stop Category 0 according to EN 60204-1
- Single-channel or two-channel control
- Manual or automatic start
- 3 enabling current paths, 1 signal current path
- Feedback loop for monitoring external contactors
* PLe contact expansion
$\square$

After this switch-on phase the enabling current paths are closed and the signaling current path is open.
If the electrical connections between terminal A1 and the supply voltage are interrupted, the enabling current paths open and the signaling current path closes. The energized state (self-locking) of the two channels is indicated by a green LED K1, K2. The second green LED indicates that supply voltage has been applied. The set-up of an emergency stop facility after stop Category 0 (EN 60204-1) is possible.

## SNO 1012K

MONITORING OF EMERGENCY STOP AND SAFETY GATES

## (ILL) Us CCC

## FUNCTION

After the operating voltage ( $\llcorner+/ L 1$ ) is applied via an unactuated emergency stop button or safety gate contact on A1 and $A 2$, the device can be switched on via a Y1/Y2-connected reset button. When the device is on, the internal relays K1 and K2 are energized and the enabling current paths $13 / 14$ and $23 / 24$ are closed. When the emergency stop button or the safety gate contact is actuated, the current supply of the internal relays is interrupted and the enabling current paths are opened.

## APPLICATIONS

- Protection of people and machinery
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Up to PL d / Category 3 (EN ISO 13849-1)
- Up to SIL 2 (EN 62061)

## FEATURES

- Stop Category 0 according to EN 60204-1
- Single-channel or two-channel control
- Manual or automatic start
- 2 enabling current paths
- Check of external contactors (EDM)
- Compact design

## SNS 4074K / SNS 4084K

## STANDSTILL MONITOR

$\Delta$ ©(1) v

## STANDSTILL MONITORING FUNCTION

The SNS 4084K standstill monitor provides for the safe monitoring of the frequency of a signal at inputs 11 to 14 of the device. If the frequency of the impulses is higher than the frequency set at the rotary switches ( $0.1-99 \mathrm{~Hz}$ ), outputs Q1/Q2 will switch off. This monitoring function can be used to detect the standstill or a lower, safer rotational speed of a machine.
In applications of this sort, a spring-actuated or magnet-actuated tumbler of an electric interlocking device, for example, can be controlled from the output of the device.
The sensors for the detection of movement can, for example, be two inductive proximity switches or a rotary encoder connected to inputs I1-14. The frequency of the impulses to be monitored is set at the two rotary switches and splitter input T1, and is stored in the device on which the ENTER button is pressed while the voltage is applied to the device.

## CIRCUIT DIAGRAM

SNS 4074K / SNS 4084K

## SNS 4074K

The device features a bypass input, which allows safety-oriented bypassing of the monitoring function, e.g. when a safe position has been reached. In this case, the signal must fulfill at least the safety category of the selected monitoring function.

## SNS 4084K

The device features an input for the implementation of a start override, which allows the safe outputs to be switched off even during machine standstill. This means, for example, that a springactivated protective locking facility can be activated during machine start-up.

## SVM 4001K

STANDSTILL MONITOR

## APPLICATIONS

- Standstill monitoring
- Monitoring of electrical lockout devices
- Control of spring-actuated tumblers
- Monitoring of low rotational speeds in setup operation
- Up to PL e / Category 4 (EN ISO 13849-1)
- Up to SIL ${ }_{c l} 3$ (EN 62061)

## FEATURES

- Sensorless monitoring of 1-phase and 3-phase motors
- Safe, configurable voltage monitoring
- Automatic operation

## (나) us

## FUNCTION

The SVM 4001K device monitors machines, the 3-phase powered drive units of which have no movement detection sensors.

When the drives are set in motion or if faults are detected, the standstill monitor relay assumes the rest position.

## SNT 4M63K

## MONITORING OF EMERGENCY STOP AND SAFETY GATES

## ©(1) us © (CC)

## FUNCTION

The device is a two-channel switching device with self-monitoring on each ON-OFF cycle. It complies with EN 60204-1 and is equipped with forcibly guided relays. It is intended for monitoring connected switching elements on separating safety devices and generating a safety-oriented signal (enable). Depending on the design, separating safety devices may include sliding safety gates, safety gates, housings, covers, sheetings, screens, etc.

## BASIC FUNCTION

With supply voltage applied to terminals A1/A2 and the safety inputs closed, pressing the reset button closes the enabling current paths (manual start). When the safety inputs are opened the enabling paths will open.

## APPLICATIONS

- Protection of people and machinery
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Up to PL e / Category 4 (EN ISO 13849-1)
- Up to SILcl 3 (EN 62061)

## FEATURES

- Stop Category 0 according to EN 60204-1
- Manual or automatic start
- Cross monitoring
- 3 enabling current paths (NO contact, forcibly guided)
- Feedback loop for monitoring external contactors
- Manual start - When the safety inputs are closed, a button is used to close reset input S34 and open it again (triggering with falling edge) or to close reset input S35 (triggering with rising edge).
- Automatic Start - Reset input S35 is connected to S33/S14. The device starts with the rising edge of the signal on safety input S14.

## SNZ 4052K

## TWO-HAND RELAY TYPE IIIC

$\triangle$ © (UL) Us

## APPLICATIONS

- Protection of people and machinery
- Monitoring of two-hand applications
- Press
- According to EN 574 Type IIIC
- Up to PL e / Category 4 (EN ISO 13849-1)
- Up to SIL ${ }_{c l} 3$ (EN 62061)

## FEATURES

- Stop Category 0 according to EN 60204-1
- Two-channel actuation; 1 NO contact and 1 NC contact for each channel
- Cross monitoring
- Monitoring of synchronous activation
- 2 enabling current paths, 1 signaling current path

## FUNCTION

The device complies with EN 574 Type III C safety requirements. The safety behavior of the device is designed for applications according to Category 4 (EN 954-1). The device is single-fault safe and self-monitoring. Synchronous activation of both actuators (two-hand momentary contact or safety gate contacts) is monitored. Each of the two actuators is connected to the device with an NO contact and an NC contact. The technical design of the input circuit provides cross connection and ground fault monitoring. The output function is designed with 2 NO contacts as an enabling current path and 1 NC contact as signaling current path (all forcibly guided).
With supply voltage applied to terminals A1/A2 and the feedback loop (terminals Y1/Y2) closed, the enabling current paths are closed by simultaneously activating the actuators (S1+S2).

Both actuators must be activated within 0.5 s for the output contacts to be enabled. If only one of the two actuators is released, the device is immediately de-energized. The enabling current paths open.
The device can be restarted only after both actuators have returned to their initial position (for example when the two-hand momentary contact switches have been released) and the feedback circuit is closed again. The feedback circuit should only be opened again after both actuators are activated. Otherwise the device will remain in the OFF position. The current status of the device is indicated by 3 LEDs: application of the supply voltage with LED SUPPLY, activation of both actuators with LED K1 and additionally with LED K2 in case of synchronous activation.

## SNZ 1022K

## TWO-HAND RELAY TYPE IIIA

$\triangle$ © (UL)

## APPLICATIONS

- Protection of people and machinery
- Monitoring of two-hand applications
- According to EN 574 Type IIIA
- Up to PL c / Category 1 (EN ISO 13849-1)
- Up to SIL 1 (EN 62061)

## FEATURES

- Stop Category 0 according to EN 60204-1
- Two-channel actuation; 1 NO contact and 1 NC contact for each channel
- Cross monitoring
- Monitoring of synchronous activation
- 1 changeover contact

## FUNCTION

After the power supply is established at terminals A1/A2 the release current paths are closed when the actuators (S1+S2) are operated at the same time. The two actuators must be operated within 0.5 s to trigger a release. If just one of the two actuators is released, the device is immediately de-energized and the enabling current path is opening.

The device can only be restarted once the two actuators are returned to their initial positions (e.g. the two-hand buttons have been released). The current status of the device is shown by 2 LEDs. The presence of the power supply is indicated with the SUPPLY LED, the operation of the two actuators with the K1 LED, if there is synchronous operation.

## SNV 4063KL

MONITORING OF EMERGENCY STOP, SAFETY GATES AND LIGHT BARRIERS, OFF-DELAYED

$\triangle$ ONV.GL $\quad$ (UL) us

## APPLICATIONS

- Protection of people and machinery
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Monitoring of light barriers
- Termination of braking operations through OFF-delay time
- Control of solenoid-actuated interlocks
- Up to PL e / Category 4 (EN ISO 13849-1) for undelayed contacts
- Up to PLd / Category 3 (EN ISO 13849-1) for delayed contacts
- Up to SILCL 3 (EN 62061)

## FEATURES

- Stop category 0/1 according to EN 60204-1
- Single-channel or two-channel control
- Manual or automatic start
- OFF-delay time adjustable in the range 0.15 to 3 s or 1.5 to 30 s
- Reset button monitoring, cross monitoring, monitoring of synchronous time
- 3 enabling current paths (2 undelayed, 1 OFF-delayed)

With a two-channel control and cross-monitoring wiring of the sensor circuit, additional errors such as short-circuit or ground fault can be detected. An electronic fuse protects the device against damage. After the cause of the malfunction has been removed, the device is operational again after approx. 3 s .

- Reset button monitoring - The device can be started either with the falling edge or with the rising edge (terminals S34 or S35). For emergency stop applications with manual start the button must be connected to terminals S33/S34. The device is enabled only with the falling edge of the reset signal. For starting, the reset button must be pressed and released. For safety gate applications in which an automatic start is performed it is necessary to bridge terminals S33/S35. The device will react at the rising edge of input S12 which is internally connected to S33.
- Monitoring of synchronous time - The use of safety limit switches for single-channel or two-channel circuits in safety gate applications depends on the required safety level. The device provides a monitoring of the synchronous time of two connected safety switches. A synchronous time $t_{s} \approx 0.5 \mathrm{~s}$ requires limit switches positioned in such a way that channel 1 , terminals S11/ S12, closes before channel 2, terminals S21/S22. If channel 2 closes before channel 1 , the synchronous time is $t_{s}=\infty$.

## SNV 4063KP

MONITORING OF EMERGENCY STOP, SAFETY GATES AND LIGHT BARRIERS, ON-DELAYED

(H1) Us (CCO

## APPLICATIONS

- Protection of people and machinery
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Monitoring of light barriers
- Monitoring of interlocking installation with position switches and integrated locking
- Control of spring-actuated interlocks
- Up to PL e / Category 4 (EN ISO 13849-1)
- Up to SILcl 3 (EN 62061)

## FEATURES

- Stop Category 0 according to EN 60204-1
- Single-channel or two-channel control
- Manual or automatic start
- ON-delay time adjustable in the range 0.15 to 3 s or 1.5 to 30 s
- Reset button monitoring, cross monitoring
- 3 enabling current paths (2 undelayed, 1 ON-delayed)

## FUNCTION

With supply voltage applied to terminals A1/A2, relays K3 and K4 (terminals 37/38) start with the pre-selected ON-delay time. The ON-delay time $t_{\text {A1 }}$ can be adjusted infinitely in the range 0.15 to 3 s or 1.5 to 30 s according to the device type. The device is enabled by pressing the reset button. The following operating modes can be selected:

## CIRCUIT DIAGRAM

## SNV 4063KP

- Manual start - The reset button must be connected to S34 through terminal S33. For starting the relay, the reset button must be pressed. Relays K3 and K4 (terminals 37/38) will switch into the OFF position. With the falling edge of the reset signal, the reset is completed and activates relays K1 and K2, which become self-locking after the response time tA3. After this switch-on phase, the 2 enabling current paths defined for the output are closed (terminals 13/14, 23/24). With the emergency stop command, the power supply to relays K1 and K2 is interrupted. The enabling current paths (terminals $13 / 14,23 / 24$ ) are immediately opened with release time tR, and relays K 3 and K 4 will start after the pre-set ON-delay time tA1, terminals 37/38. Three LEDs display the state of relays $\mathrm{K} 1 / \mathrm{K} 2, \mathrm{~K} 3 / \mathrm{K} 4$ and the supply voltage.
- Automatic start - For monitoring of interlocking installations with locking mechanism or safety gate applications in which on automatic start shall be performed it is necessary to jumper terminals S33/S35. The device will react at the rising edge of input S12 that is internally connected to S33. Relays K3 and K4 (terminals $37 / 38$ ) will switch into the OFF position. With the rising edge of input S12 the relay K1 is activated and response time tA2 started. When the time has elapsed, the 2 enabling current paths are closed (terminals $13 / 14,23 / 24$ ). With a stop command the power supply to relays K1 and K2 is interrupted. The enabling current paths (terminals $13 / 14,23 / 24$ ) are immediately opened with release time $t R$, and relays K 3 and K 4 will start after the pre-set ON-delay time tA1, terminals 37/38.

## SNV 4074SL / SNV 4076SL

MONITORING OF EMERGENCY STOP, SAFETY GATES AND LIGHT BARRIERS, OFF-DELAYED

$\Delta$

## OFF-DELAY FUNCTION

After the supply voltage is applied to terminals A1/A2 and the safety inputs are closed, the enabling current paths (NO contacts) are closed automatically or by pressing the reset button (manual start). When the safety inputs are opened/de-energized the enabling current paths (NO contacts are opened immediately or with a delay).

## APPLICATIONS

- Controlled stop according to Category 1 (EN 60204-1)
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Monitoring of interlocks
- Monitoring of light barriers
- Up to PL e / Category 4 (EN ISO 13849-1)
- Up to SIL 3 (EN 62061)

## FEATURES

- Stop Category 0/1 according to EN 60204-1
- Time setting in 10 steps
- Time ranges 3 s , 30 s or 300 s
- Single-channel or two-channel control
- Manual or automatic start
- SafeStart
- Cross monitoring
- Automatic start - Reset input S14 is connected to safety input S12. To monitor external contact blocks (EDM), their NC contacts must be connected in series between S34 and S12.
- Manual start without monitoring - Reset input S14 is connected to safety input S12 via a reset button. To monitor external contact blocks (EDM), their NC contacts must be connected in series to the reset button.
- Manual start with monitoring - Reset input S34 is connected to safety input S11 via a reset button. To monitor external contact blocks (EDM), their NC contacts must be connected in series to the reset button.

## SNV 4274SL / SNV 4074ST - MONITORING OF EMERGENCY STOP,

LIGHT BARRIERS AND SAFETY GATES, OFF-DELAYED/ON-DELAYED

## OFF-DELAY WITH RETRIGGERING FUNCTION (SNV 4274SL)

After the supply voltage is applied to terminals A1/A2 and the safety inputs are closed, the contacts are switched on immediately, either automatically or by pressing the reset button (manual start). When the safety inputs are opened/de-energized, the contacts are switched off immediately or with a release delay.

The set release delay only expires if the safety inputs are opened longer than the release delay set on the device. If the safety inputs are closed again before the release delay has expired (retriggering), the delayed contacts will remain closed, too.

## APPLICATIONS

- Monitoring of limit values in the process industry
- Monitoring of emergency stop applications
- Monitoring of safety gates
- Monitoring of interlocks
- Monitoring of light barriers
- Up to PL e / Category 4 (EN ISO 13849-1)
- Up to SILcl 3 (EN 62061)

## FEATURES

- Continuously adjustable, analog time setting
- Time ranges 3 s , 30 s or 300 s
- Retriggering of the time delay possible
- Single-channel or two-channel control
- Manual or automatic start
- SafeStart
- Cross monitoring

## ON-DELAY FUNCTION (SNV 4074ST)

After the supply voltage is applied to terminals A1/A2 and the safety inputs are closed, the contacts are switched on immediately or with a response delay, either automatically or by pressing the reset button (manual start). When the safety inputs are opened/ de-energized the contacts are switched off immediately.

## SNE 1

CONTACT EXPANSION

## APPLICATIONS

- Duplication of the enabling current paths of a basic device
- Contact expansion in safety-oriented systems
- Up to PL e Category 4 (EN ISO 13849-1)*
- Up to SILcl 3 (EN 62061)*

## FEATURES

- Stop Category 0 and 1 according to EN 60204-1
- Single-channel operation
- 2 changeover contacts (positively driven)
- Sturdy retaining bracket
* Depends on the category of the basic device or the safety control.

## SNE 4003K

CONTACT EXPANSION

## -(UL) us (CCC

## FUNCTION

The SNE 4003K is an expansion device for basic devices (such as safety switching devices, light curtains, laser scanners) that are part of the machine's safety equipment and are used for protecting people, materials and machines.
The device is designed with two channels and redundancy. There is basic insulation to separate the enabling current paths from one another and the control circuits from the signaling current paths. The broad input voltage range of $15 \mathrm{~V} D C$ to 30 V DC makes the SNE 4003K ideal for single-channel or two-channel control by semiconductors.

## APPLICATIONS

- Duplication of the enabling current paths of a basic device
- Contact expansion in safety-oriented systems
- Contact expansion for light curtains
- Up to PL e / Category 4 (EN ISO 13849-1)*
- Up to SILcl 3 (EN 62061)*

## FEATURES

- Single-channel or two-channel operation
- 3 enabling current paths (NO contact)
- 2 signaling current paths (NC contact)
- Wide input voltage range from 15 to 30 V DC
- Suitable for semiconductor outputs
* Depends on the category of the basic device or the safety control.

Input voltage to the SNE 4003 K is connected via one or two enabling current paths of a basic device. When the input voltage is applied relays K1 and K2 switch into the ON position. After this switch-on phase, enabling current paths 13/14, 23/24, 33/34 are closed and feedback current path $Y 1 / Y 2$ and signaling current path 41/42 are opened.
This is displayed through two LEDs, K1 and K2, which are assigned to relays K1 and K2. If the enabling current paths of the basic device are opened when the emergency stop button is pressed, relays K1 and K2 on the SNE 4003K switch back into the OFF-position. The enabling current paths open and the feedback current path closes. Feedback current path Y1/Y2 prevents the basic device from switching on again before K1 or K2 releases.

## SNE 4004K/KV

## CONTACT EXPANSION

## © (UL) <br> © (cc)

## FUNCTION

## SNE 4004K

Supply voltage to the SNE devices is routed via an enabling current path of a basic device. When the supply voltage is applied relays K1 and K2 switch into the ON position. After this switch-on phase the four enabling current paths $13 / 14,23 / 24,33 / 34,43 / 44$ (of the SNE 4004 K ) or $17 / 18,27 / 28,37 / 38,47 / 48$ (of the SNE 4004 KV ) are closed and the feedback current path $Y 1 / Y 2$ is open. This is displayed through two LEDs that are assigned to relays K1 and K2.

When the enabling current paths of the basic device are opened through the operation of the emergency stop button, relays K1 and K2 on the SNE 4004K switch back into the OFF-position. The enabling current paths open and the feedback current path closes. Feedback current path $\mathrm{Y} / \mathrm{Y} 2$ prevents the basic device from switching on again before K1 or K2 releases.

## APPLICATIONS

- Expansion of a basic device's enabling current paths
- Contact expansion in safety equipment
- Up to PL d / Category 3 (EN ISO 13849-1)*
- Up to SILcl 2 (EN 62061)*

## FEATURES

- Stop Category 0 and 1 according to EN 60204-1 (see "Function")
- Single-channel or two-channel control
- SNE 4004K: 4 enabling current paths, undelayed (NO contact) 3 signaling curent paths, undelayed (NC contact)
- SNE 4004KV: 4 enabling current paths, OFF-delayed (NO contact)
3 signaling current paths, OFF-delayed (NC contact), Time buffering
* Depends on the category of the basic device or the safety control.

## SNE 4004KV

The functions of this device correspond to those of the SNE 4004K. The SNE 4004 KV is available with the following four OFF-delay times $t_{\text {R1 }}: 0.5 \mathrm{~s} ; 1 \mathrm{~s} ; 2 \mathrm{~s}$ and 3 s . The device has an OFF-delay time that is enabled through capacitors.
This causes the OFF-delay time $t_{R 1}$ to elapse completely even in case of failure of the power supply (A1/A2). It cannot be reset before it has elapsed. Once the delay time has elapsed, relays K1 and K2 switch into the OFF- position. OFF-delay times of $>0$ s correspond to stop category 1.

## CONTACT EXPANSION

$\triangle$ ©(1) us ©

## FUNCTION

Once the supply voltage has been applied to terminals B1/A2 (B2/ A2), the enabling current paths (NOC) are automatically closed and the signaling current paths (NCC) are opened.
When the supply voltage is ceased, the enabling current paths (NOC) are immediately opened and the signaling current paths (NCC) are immediately closed.

## APPLICATIONS

- Expansion of a basic device's enabling current paths
- Contact expansion in safety equipment
- Up to PL e / Category 3 (EN ISO 13849-1)*
- Up to SILcl 3 (EN 62061)*

## FEATURES

- Stop Category 0 and 1 according to EN 60204-1 (see "Function")
- Single-channel control
- SNE 4012K: 2 enabling current paths (NO contact)
- SNE 4024K: $2 \times 2$ enabling current paths (NO contact)
* Depends on the category of the basic device or the safety control.
