YASKAWA AC Drive Compact Vector Control Drive V1000

200 V CLASS, THREE-PHASE INPUT: 0.1 to 18.5 kW
200 V CLASS, SINGLE-PHASE INPUT: 0.1 to 3.7 kW
400 V CLASS, THREE-PHASE INPUT: 0.2 to 18.5 kW

So advanced !

So easy !

So small !

Bringing you the world's smallest* variable speed drive to stand at the top of its class: V1000

Yaskawa has built a reputation for high performance, functionality, quality, and reliability. To make it even easier to optimize your applications, we present the new V1000.

A single drive with so many uses, benefiting your application the more you use it.

So advanced!

*: Results from market research on vector drives performed by Yaskawa.

Quick and easy installation, ready to run your application in no time. You'll be amazed how simple it is to use.

So easy!

Smallest in the world!

Top performance for its class. Loaded with functions and features in an unbelievably small package!

V1000

Features

Yaskawa offers solutions customized for your application in an incredibly compact, technologically advanced, environmentally responsible package capable of driving a synchronous motor.

So advanced!

Sensorless Control of PM Motors Capability

Two drives in one

V1000 runs not only induction motors, but synchronous motors like IPM and SPM motors as well. Get a single drive for all your application needs, and save on spare parts.

Note: See product specifications for information on motor precision.
The variable torque ratio of synchronous motors is 1 to 10.

V1000

Top of Its Class

Impressive Torque Characteristics

V1000 is the first in its class fully equipped with current vector control. Current Vector control providing a powerful starting torque of 200% at 0.5 Hz* and precise torque limit operations. The motor Auto-Tuning function saves valuable start up time and assures high performance operation at the highest efficiency.

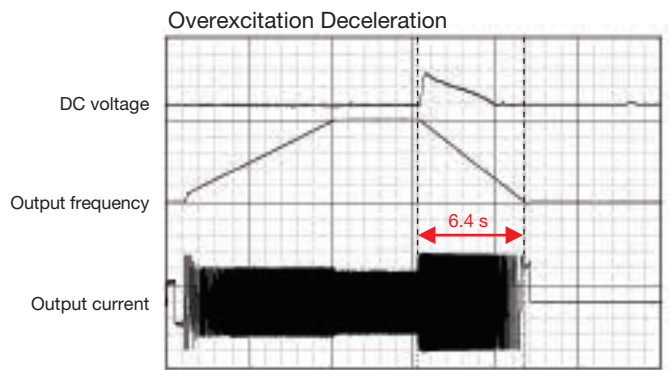

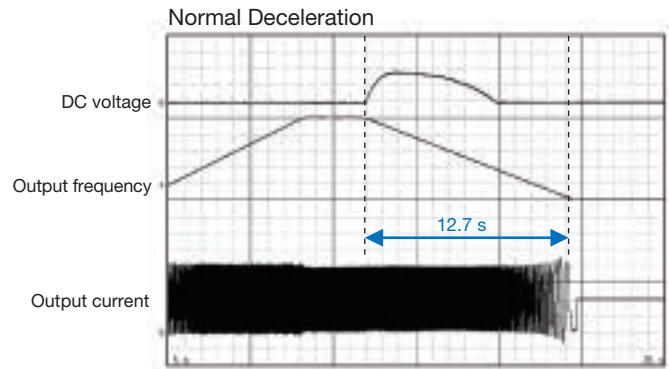

*: Using a Yaskawa induction motor under 3.7 kW set for Heavy Duty torque performance.

Increased braking power during deceleration.

Faster deceleration time with overexcitation braking.*

*: Example shown is for a 400 V 3.7 kW drive without braking resistor. Circumstances depends on the motor and load.

50% faster!

simplest, smallest drive of its class.

No more trouble from power loss.

V1000 is fully equipped with speed search and KEB Ride-Thru functions for your application needs, whether running an induction motor or permanent magnet motor.

● Speed Search Method

Easily restart the motor without cumbersome speed sensors. Perfect for fan, blowers, and other rotating, fluid-type applications.

● KEB Ride-Thru

Drive continues operation by using motor regen. Perfect for HVAC

Note: Requires a sensor to detect when power loss occurs. Load conditions may still trip a fault and cause the motor to coast.

Drive Specialization

Software for High-Frequency Output

Yaskawa can offer you a drive with custom software with the specific functions required for your machine.

Customize the Drive

Optional visual programming software lets you instantly customize V1000 to your application. Let the drive do external device or PLC functions! Easy Drag and Drop functions starting from simple timers up to complex application blocks let you create your very own drive.

So much variation possible

Global Networking

The built in high speed RS-422/485 MEMOBUS/Modbus (RTU mode) Communications and a variety of option units connect V1000 to all popular fieldbus networks. The optional 24 V power supply keeps the drive controller alive under all conditions, providing network communications and monitoring functions even during a main power loss.

EU's RoHS Compliance

All V1000 models are fully compliant with the EU's RoHS initiative.

Features

From setup to maintenance, V1000 makes life easy.

So easy!

Parameters set automatically—hassle free programming!

Start up instantly with application presets!

V1000 automatically sets the parameters needed for various applications. Presets for water supply pumps, conveyor systems, exhaust fans, and other applications program the drive instantly for optimized performance—saving enormous hassle setting up for a test run.

Breeze-Easy Setup

Install Multiple Drive Immediately with the USB Copy Unit

Get several drives up and running easily using the USB copy unit. The same copy unit is fully PC compatible.

Hassle free setting and maintenance straight from a PC

DriveWizard Plus lets you manage the unique settings for all your drives right on your PC.

With DriveWizard's preset operation sequences, built-in oscilloscope function, fine tuning the drive and maintenance checks have never been easier.

- Drive Replacement Function**
 Saves valuable time during drive set up when replacing or upgrading drives.
- Sequence Operation**
 View and edit drive parameters.
- Oscilloscope Function**
 Displays operation status and drive performance in real time.

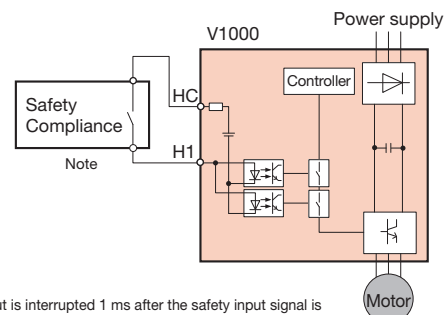

Optimal Drive

Optimal Drive

Safety Standard Compliance TÜV approved

V1000 is the first drive in its class to come standard with safety input features compliant with ISO/EN13849-1 Cat.3 PLd, IEC/EN61508 SIL2.

Through compliance with EN60204-1 (stop category 0), V1000 reduces the number of peripheral devices needed to satisfy safety regulations.

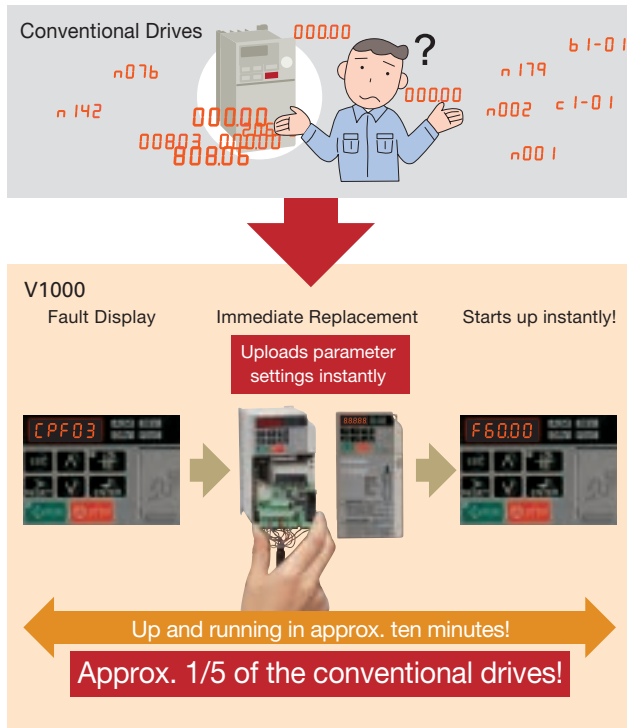

Note: Output is interrupted 1 ms after the safety input signal is triggered.
 Make sure safety input wiring does not exceed 30 m.

Application Example: Safety Compliance

Hassle-Free Maintenance

Less Downtime

The first-ever pluggable terminal board with a Parameter Back-Up function lets you replace a drive instantly in the event of failure. No need to re-program the replacement drive—an amazingly convenient time saver!

Exceptional Performance Life

Cooling fan and capacitors have an expected performance life of ten years. In addition, Maintenance Monitors keep track of part wear.

Note: Assumes the drive is running continuously for 24 hours a day at 80% load with an ambient temperature of 40°C with an IP20 open-chassis enclosure.

Simple Wiring

A pluggable terminal block option is available. Screwless terminals do away with time consuming wiring and periodic maintenance to check wire connections, which in turn makes the drive more reliable. Contact Yaskawa for inquiries.

Wide Array of Monitors

Monitor functions like output frequency, output current, I/O status and watt hour counter give a clear picture of the drive operation status and helps to keep track of the energy consumption.

Verify Menu

The Verify Menu lists all setting that have been changed from their original default values. This includes parameters changed by Auto-Tuning, Application Presets, and those edited by the technician. This list makes it easy to reference changes to drive setup.

The world's smallest!

The perfect space-saving design

World's Smallest Class

Yaskawa has applied the most advanced thermal simulation technology and top reliability to create the world's smallest compact drive. V1000 reduces the space required up to 70% when compared to our earlier models.

● Compare the size difference of a 200 V 5.5 kW drive with V1000 rated for Normal Duty operation:

Side-by-Side

V1000 allows for a truly compact installation, requiring minimal space between units even in a tight enclosure.

Note: Current derating must be considered.

● Example: Side-by-Side installation of 200 V 0.75 kW units

Note: If the last drive in a series is installed next to a wall, a 30 mm gap is required.

Fluid Applications

Advantages

- 1 Selecting "Fan" or "Pump" presets automatically programs V1000 for optimal performance.
- 2 Compact design saves installation space. Use a permanent magnet motor to shrink the installation even further while conserving impressive amounts of energy.

- 3 Pulse output provided to keep track of kilowatt hours-- no power meter needed. (Cannot legally be used as proof of power consumption.)
- 4 Speed Search prevents loss from down time by keeping the application running smoothly through a power loss.
- 5 An optional 24 V power supply lets you monitor drive performance from a PLC even when the power goes out.
- 6 Replace drives immediately and easily thanks to a pluggable terminal board with a built-in Parameter Back-Up function.

Applications

Conveyor, Transport, and Civil Applications

Advantages

- 1 Selecting the “Conveyor” preset automatically programs V1000 for optimal performance.
- 2 Safety input functions standard. Easily complies with various safety regulations.
- 3 Overexcitation braking provides more powerful braking capabilities.
- 4 Easily customize the drive through visual programming with DriveWorksEZ.
- 5 With a variety of communication protocols options available, V1000 can be networked instantly. A separate 24 V power supply is also available, allowing the technician to monitor drive performance from a PLC even when the power goes out.
- 6 IP66 and NEMA 4 Type 1 models are available. Provides water-proof and dust-proof protection and separate installation.

NEW New Functions New software functions for V1000

Applications

Software Functions

Loaded with software functions just right for your application.

Note: Major functions listed below.

New Functions New V1000 software not available for the V7.

NEW
Application Presets

No need to struggle with difficult parameters and complex calculations. Parameters are set instantly simply by selecting the appropriate Application Preset.

Functions at Start and Stop

NEW
Optimal Deceleration

Optimal deceleration without needing to set the deceleration time. Drive slows the application smoothly controlling DC bus voltage.

NEW
Overexcitation Braking

Perfect for applications with high load inertia that rarely need to be stopped. Stop quickly—50% faster without the use of a braking resistor. Note: Stopping times may vary based on motor characteristics.

DC Injection Braking at Start

Halt a coasting motor and start it back up again. When the direction of a coasting motor is unknown, the drive automatically performs DC Injection to bring the motor to a halt and then start it back up again.

Speed Search

Start a coasting motor. Automatically brings a coasting motor back to the target frequency without the need for extra speed sensors.

Dwell Function

Accelerate and decelerate smoothly with large inertia loads. Drive prevents speed loss by holding the output frequency at a constant level during acceleration and deceleration.

Accel/Decel Time Switch

Switch easily between accel/decel times. Switch acceleration and deceleration rates when running two motors from the same drive, or change accel/decel times when operating at high speed.

S-Curve Characteristics

Prevent sudden shock when starting and stopping the application. Drive lets the user fine-tune the S-curve characteristics, allowing for smooth acceleration and deceleration.

Reference Functions

Frequency Reference Upper/Lower Limits

Limit motor speed. Set speed limits and eliminate the need for extra peripheral devices and extraneous hardware.

Multi-Step Speed

Easily program a speed sequence with multiple steps. Set up to 17 separate speeds to create a speed sequence for the application. The drive can easily be connected to a PLC and allow for a simple positioning with limit switches.

Frequency Jump

Skip over troublesome resonant frequencies. Drive can be programmed to avoid machine resonance problems by avoiding constant speed operation at certain speeds.

Frequency Reference Hold

Improved operability. Momentarily hold the operating frequency during acceleration or deceleration as the load is lowered or raised.

Up/Down

Improved operability. Raise or lower the frequency reference using a remote switch.

NEW
LOCAL/REMOTE

Switch between remote operating locations. Easily switch between controlling the drive directly with the keypad or from a control panel at some remote location.

Functions for Top Performance

NEW
IM/PM Control

Run both IM and PM motors with a single drive. The most advanced motor drive technology can run both IM and PM motors, allowing for even greater energy savings and a more compact setup.

NEW
Watt-Hour Pulse Monitor

No extra watt hour meter needed. A pulse output lets the user monitor power consumption. (Cannot legally be used as proof of power consumption)

Energy Saving

Automatically runs at top efficiency. The drive supplies voltage to the motor relative to the speed and load so that the application is for operating at the most efficient level.

NEW
Online Tuning

Enables high-precision operation. Automatically adjusts resistance between motor conductors during operation, thus improving speed accuracy when there are motor temperature fluctuations. This function is active only for Open Loop Vector Control.

NEW
Current Vector

Achieve high levels of performance. The drive comes with current vector control capabilities for high performance applications.

NEW

Drive
WorksEZ**Customize the perfect drive to fit your needs.**

Upper controller circuitry and drive I/O terminals can be programmed so that extra hardware is no longer needed. Drag-and-drop visual programming makes customization a breeze.

NEW

Timer
Function**No need for extra hardware.**

Control timing by opening and closing the output signal relative to the input signal.

NEW

PTC
Input**Thermal protection provided by a PTC located in the motor windings.**

Protect the motor from over heat by directly connecting the PTC to the drive.

PID
Control**Automatic PID control.**

The internal PID controller fine-adjusts the output frequency for precise control of pressure, flow or other process parameters.

NEW

Motor 2
Switch**One drive runs two motors.**

Use a single drive to operate two different motors. (Only one PM motor may be used)

Pulse Train
Input**Improved operability.**

Use the Pulse Train Input to control not only the frequency reference, but also PID feedback and PID input.

Pulse Train
Output**Improved monitor functions.**

Pulse output lets the user observe everything from the frequency reference and output frequency to motor speed, softstart output frequency, PID feedback, and PID input.

Frequency
Detection**Use frequency detection for brake control.**

The drive can output a signal when the output frequency exceeds a specified level.

Overtorque
Detection**Keep the application running while protecting connected machinery.**

Overtorque detection senses motor torque and notifies the user immediately when a filter clogs or the machine is blocked by mechanical problems.

Undertorque
Detection**Better reliability: Keep the application running while protecting the load.**

Fault detection senses any drop in motor torque due to broken belts or worn transmission.

NEW

Torque
Limit**Better reliability: Keep the application running while protecting the load.**

V1000 helps protect your application by restricting the amount of torque the motor can create.

Protective Functions

Momentary
Power
Loss
Ride-Thru**Keep running even during a momentary loss in power.**

V1000 automatically restarts the motor and keeps the application going in the event of a power loss.

NEW

KEB
Function**Decelerate to stop when the power goes out.**

V1000 uses regenerative energy from the motor to bring the application to a stop, rather than simply letting it coast.

Stall
Prevention**Better reliability: Keep the application running while protecting the load.**

Keeps the machine running by preventing motor stall caused by motor overload or rapid speed changes.

NEW

Overvoltage
Suppression**Avoid overvoltage trip.**

Effective for punching presses and crank shafts where repetitive motion creates large amounts of regenerative energy. The drive increases or decreases the frequency in correspondence with regen levels to prevent overvoltage from occurring.

Reference
Loss
Operation**Better reliability for continuous operation.**

The drive can keep running at the most recent frequency reference it was given in the event that the upper controller should fail. An absolute must for HVAC systems.

Fault
Restart**Keep running when a fault occurs.**

V1000 has full self-diagnostic features and can restart the application in the event of a fault. Up to 10 restarts possible.

*1: Default setting depends on the control mode.

*2: Parameter setting value is not reset to the default value during drive initialization, A1-03 = 1110, 2220, 3330.

*3: Parameter A1-05 is hidden from view. To display A1-05, access parameter A1-04 and simultaneously depress the STOP key and the Up arrow key.

*4: If A1-02 = 0 or 2, the default setting depends on the capacity of the drive. If A1-02 = 5, the default setting is 0.30.

*5: The accel/decel time setting range determines the value of the units set to C1-10.

Note: For software version PRG: 1024 or later. Verify the software version by checking either the nameplate on the drive or parameter U1-25.

Basic Instructions

Outstanding operability! Separate settings for each application enables quick set-up.

Operator Names and Functions

Data display (5-digit)
Displays frequency, parameter number, and other data.

LO/RE light
Lights to indicate that the operator is set for LOCAL.

ESC key
Lets the user back up to the previous display screen.

Right arrow key
Scrolls the cursor to the right.

RESET key
Resets a fault.

RUN light
Lights when the Run command is present.

RUN key
Issues a Run command.

Glossary
Used as a quick guide for the abbreviations used on the display screen. Details listed on the next page.

LED panel
More information listed below.

LO/RE key
Determines where the Run command and frequency reference come from: the keypad (LOCAL) or the control terminals (REMOTE).

ENTER key
Press to enter values, edit parameters, and set the control mode. Press this key to proceed to the next screen when scrolling through various menu displays.

Com port
For connecting to a PC (DriveWizard or DriveWorksEZ), a USB copy unit or a LCD operator.

Up arrow key
Scrolls up through the display screen, and increases a selected value.

Down arrow key
Scrolls down through the display screen, and decreases a selected value.

STOP key
Issues a Stop command.

Operation Example

Using the LED Operator to Run the Drive

Steps	Key	Result/Display
1 Turn the power on.		F 000
2 Set the drive for LOCAL. The frequency reference is displayed.		LO should light. F 000
3 Displays the direction (forward).		For
4 Displays the output frequency.		000
5 Displays the output current.		000A
6 Displays the output voltage.		00V
7 Displays the beginning of the Monitor Menu.		flashing r7on
8 Displays the top of the Verify Menu.		flashing urF4
9 Displays the top of the Setup Mode.		flashing S7UP
10 Displays the top of the parameter settings menu.		PAR
11 Displays the top of the Auto-Tuning Mode.		Autn
Returns back to the frequency reference display.		F 000

Value will flash when it is possible to change the setting.

Drive Mode: Run and Stop commands, displays operation status such as the frequency reference, output frequency, output current, output voltage, etc.

How to Monitor the Frequency Reference

Steps	Key	Result/Display
Use the arrow keys to select the digits to set.		F00.00
		F00.00
Press enter to save the new value.		F06.00
		F06.00
		F06.00 "End" appears while the drive saves the new data. DRV DRV lights up.

Monitor Mode: Displays operation status and information on faults.

Steps	Key	Result/Display
Select a monitor.		U1-01
Displays U1-01, the frequency reference monitor.		6.00
Select another monitor.		U1-01
		U1-02
		U1-02
		U1-26
Back up to the top of the Monitor Menu.		r7on

Verify Menu: Lists all parameters that have been changed from their original default settings, either by the user or from Auto-Tuning.

Steps	Key	Result/Display
Lists parameters that have been changed in order.		C1-01
Pressing Enter displays the parameter value.		0003.0
		C1-01
		C1-02
		C1-02
		C6-02
Returns to the top of the Verify Menu.		urF4

Press to go back to the previous display screen.

Setup Mode

The list of Applications Presets can be accessed in the Setup Mode. Each Application Preset automatically programs drive parameters to their optimal settings specific to the application selected. All parameters affected by the Application Preset are then listed as Preferred Parameters for quick access.

Selecting a Water Supply Pump (A1-06=1)

Steps	Key	Result/Display
Application Selection		APPL
		00
		00
Select, "Water Supply Pump".		01
		APPL

All parameters relating to the preset values for a water supply pump application are then listed as Preferred Parameters.

Scroll to the Preferred Parameter using the up arrow key and see which parameters have been selected.

"End" appears while the drive saves the new data.

Model Number Key

Optimizing Control for Each Application

V1000 offers two separate performance ratings: Normal Duty and Heavy Duty.

Heavy Duty is capable of creating more powerful torque, while Normal Duty allows the drive to operate a larger motor.

Difference between load ratings:

	Normal Duty Rating	Heavy Duty Rating
Parameter settings	C6-01 = 1 (default)	C6-01 = 0
Overload tolerance	120% for 60 s	150% for 60 s
Carrier frequency	Low carrier frequency (Swing PWM)*	High carrier frequency

*: Use Swing PWM to quiet undesirable motor noise generated when operating with a low carrier frequency.

Normal Duty Applications

Heavy Duty Applications

*The applications shown above can still use the ND rating, provided that the maximum torque required is no more than 120% for 60 s.

● Selecting a Drive

For a fan application using a 0.75 kW motor, select CIMR-VA2A0004 and set it for Normal Duty performance.

Model: CIMR-VA2A0004

● Selecting a Drive

For a chain block application using a 0.75 kW motor, select CIMR-VA2A0006 and set it for Heavy Duty performance.

Model: CIMR-VA2A0006

Use the table below to transition from VS mini V7 to the V1000 series (assumes a Heavy Duty rating).

*1: Heavy Duty (3.7 kW) only.

*2: Drives with a single-phase power supply input have three-phase output. Single-phase motors cannot be used.

*3: The motor capacity (kW) refers to a Yaskawa 4-pole, 60 Hz, 200 V motor. The rated output current of the drive output amps should be equal to or greater than the motor rated current.

*4: Rated output capacity is calculated with a rated output voltage of 220 V.

*5: This value assumes a carrier frequency of 2 kHz. Increasing the carrier frequency requires a reduction in current.

*6: This value assumes a carrier frequency of 10 kHz. Increasing the carrier frequency requires a reduction in current.

*7: This value assumes a carrier frequency of 8 kHz. Increasing the carrier frequency requires a reduction in current.

*8: Not compliant with the UL standards when using a DC power supply. To meet CE standards, fuses should be installed. For details, refer to page 37.

*9: Rated input capacity is calculated with a power line voltage of 240 V × 1.1.

Common Specifications

Rotational Auto-Tuning must be performed to achieve the performance described with Open Loop Vector Control.

Item	Specifications	
Control Characteristics	Control Method	Open Loop Vector Control (Current Vector), V/f Control, PM Open Loop Vector Control (for SPM and IPM motors)
	Frequency Control Range	0.01 to 400 Hz
	Frequency Accuracy (Temperature Fluctuation)	Digital reference: within $\pm 0.01\%$ of the max. output frequency (-10 to $+50^{\circ}\text{C}$)
		Analog reference: within $\pm 0.1\%$ of the max. output frequency ($25 \pm 10^{\circ}\text{C}$)
	Frequency Setting Resolution	Digital reference: 0.01 Hz
		Analog reference: 1/1000 of max. frequency
	Output Frequency Resolution	20 bit of maximum output frequency (parameter E1-04 setting)
	Frequency Setting Signal	Main frequency reference: 0 to 10 Vdc (20 k Ω), 4 to 20 mA (250 Ω), 0 to 20 mA (250 Ω) Main speed reference : Pulse Train Input (max. 32 kHz)
	Starting Torque	200% / 0.5 Hz (assumes Heavy Duty rating IM of 3.7 kW or less using Open Loop Vector Control),* ¹ 50% / 6 Hz (assumes PM Open Loop Vector Control)
	Speed Control Range	1:100 (Open Loop Vector Control), 1:20 to 40 (V/f Control), 1:10 (PM Open Loop Vector Control)
	Speed Control Accuracy	$\pm 0.2\%$ in Open Loop Vector Control ($25 \pm 10^{\circ}\text{C}$) * ²
	Speed Response	5 Hz in Open Loop Vector ($25 \pm 10^{\circ}\text{C}$) (excludes temperature fluctuation when performing Rotational Auto-Tuning)
	Torque Limit	Open Loop Vector Control allows separate settings in four quadrants
	Accel/Decel Time	0.0 to 6000.0 s (4 selectable combinations of independent acceleration and deceleration settings)
Protection Function	Braking Torque	① Short-time decel torque* ³ : over 150% for 0.1/0.2 kW motors, over 100% for 0.4/ 0.75 kW motors, over 50% for 1.5 kW motors, and over 20% for 2.2 kW and above motors (overexcitation braking/High-Slip Braking: approx. 40%) ② Continuous regen. torque: approx. 20% (approx. 125% with dynamic braking resistor option* ⁴ : 10% ED, 10 s, internal braking transistor)
	V/f Characteristics	User-selected programs, V/f preset patterns possible
	Main Control Functions	Momentary power loss ride-thru, Speed search, Overtorque detection, Torque limit, 17-step speed (max), Accel/decel time switch, S-curve accel/decels, 3-wire sequence, Auto-tuning (rotational, stationary tuning for resistance between lines), Dwell, Cooling fan on/off switch, Slip compensation, Torque compensation, Frequency jump, Upper/lower limits for frequency reference, DC injection braking at start and stop, Overexcitation braking, High slip braking, PID control (with sleep function), Energy saving control, MEMOBUS/Modbus (RTU mode) comm. (RS-485/422 max, 115.2 kbps), Fault restart, Application presets, DriveWorksEZ (customized function), Removable terminal block with parameter backup function...
Operating Environment	Motor Protection	Motor overheat protection based on output current
	Momentary Overcurrent Protection	Drive stops when output current exceeds 200%* ⁵ of Heavy Duty Rating
	Overload Protection	Drive stops after 60 s at 150% of rated output current (Heavy Duty Rating)* ⁶
	Overvoltage Protection	200 V class: Stops when DC bus exceeds approx. 410 V
		400 V class: Stops when DC bus exceeds approx. 820 V (approx. 740 V when power supply voltage is less than 400 V)
	Undervoltage Protection	Three-phase 200 V class: Stops when DC bus falls below approx. 190 V
		Single-phase 200 V class: Stops when DC bus falls below approx. 160 V
		Three-phase 400 V class: Stops when DC bus falls below approx. 380 V (approx. 350 V when the power supply voltage is less than 400 V)
	Momentary Power Loss Ride-Thru	Stops after approx. 15 ms (default). Parameter settings allow the drive to continue running if power loss lasts for up to approx. 2 s * ⁷
	Heatsink Overheat Protection	Protection by thermistor
Braking Resistance Overheat Protection	Overheat sensor for braking resistor (optional ERF-type, 3% ED)	
Stall Prevention	Separate settings allowed during acceleration, and during run. Enable/disable only during deceleration.	
Standards Compliance	Ground Fault Protection	Protection by electronic circuit * ⁸
	Charge LED	Charge LED remains lit until DC bus has fallen below approx. 50 V
Protection Design	Area of Use	Indoors
	Ambient Temperature	-10 to $+50^{\circ}\text{C}$ (open chassis), -10 to $+40^{\circ}\text{C}$ (enclosure)
	Humidity	95 RH% or less (no condensation)
	Storage Temperature	-20 to $+60^{\circ}\text{C}$ (short-term temperature during transportation)
	Altitude	Up to 1000 meters
	Shock	10 to less than 20 Hz (9.8 m/s ²) max., 20 to 55 Hz (5.9 m/s ²) max.
Standards Compliance	<ul style="list-style-type: none"> ·UL508C ·IEC/EN61800-3, IEC/EN61800-5-1 ·ISO/EN13849-1 Cat.3 PLd, IEC/EN61508 SIL2 	
Protection Design	IP20 open-chassis, UL Type 1 enclosure	

*1: The capacity of the drive and motor must be considered to achieve this torque output.

*2: Speed control accuracy may vary slightly depending on installation conditions or motor used.

*3: Momentary average deceleration torque refers to the deceleration torque from 60Hz down to 0 Hz. This may vary depending on the motor.

*4: Disable Stall Prevention during deceleration by setting L3-04 (Stall Prevention Selection during Deceleration) to 0 (Disabled) when using a Braking Resistor or Braking Resistor Unit. The motor may not stop within the deceleration time if this setting is not changed from 1 (Enabled: default).

*5: 200% is the target value. The value varies depending on the capacity.

*6: Overload protection may be triggered at lower levels if output frequency is below 6 Hz.

*7: Varies by drive capacity. Drives smaller than 7.5 kW (CIMR-VA2A0040/ CIMR-VA4A0023) require a separate Momentary Power Loss Recovery Unit to continue operating during a momentary power loss of 2 s.

*8: Protection is provided when the motor is grounded during Run. Protection may not be provided under the following conditions:

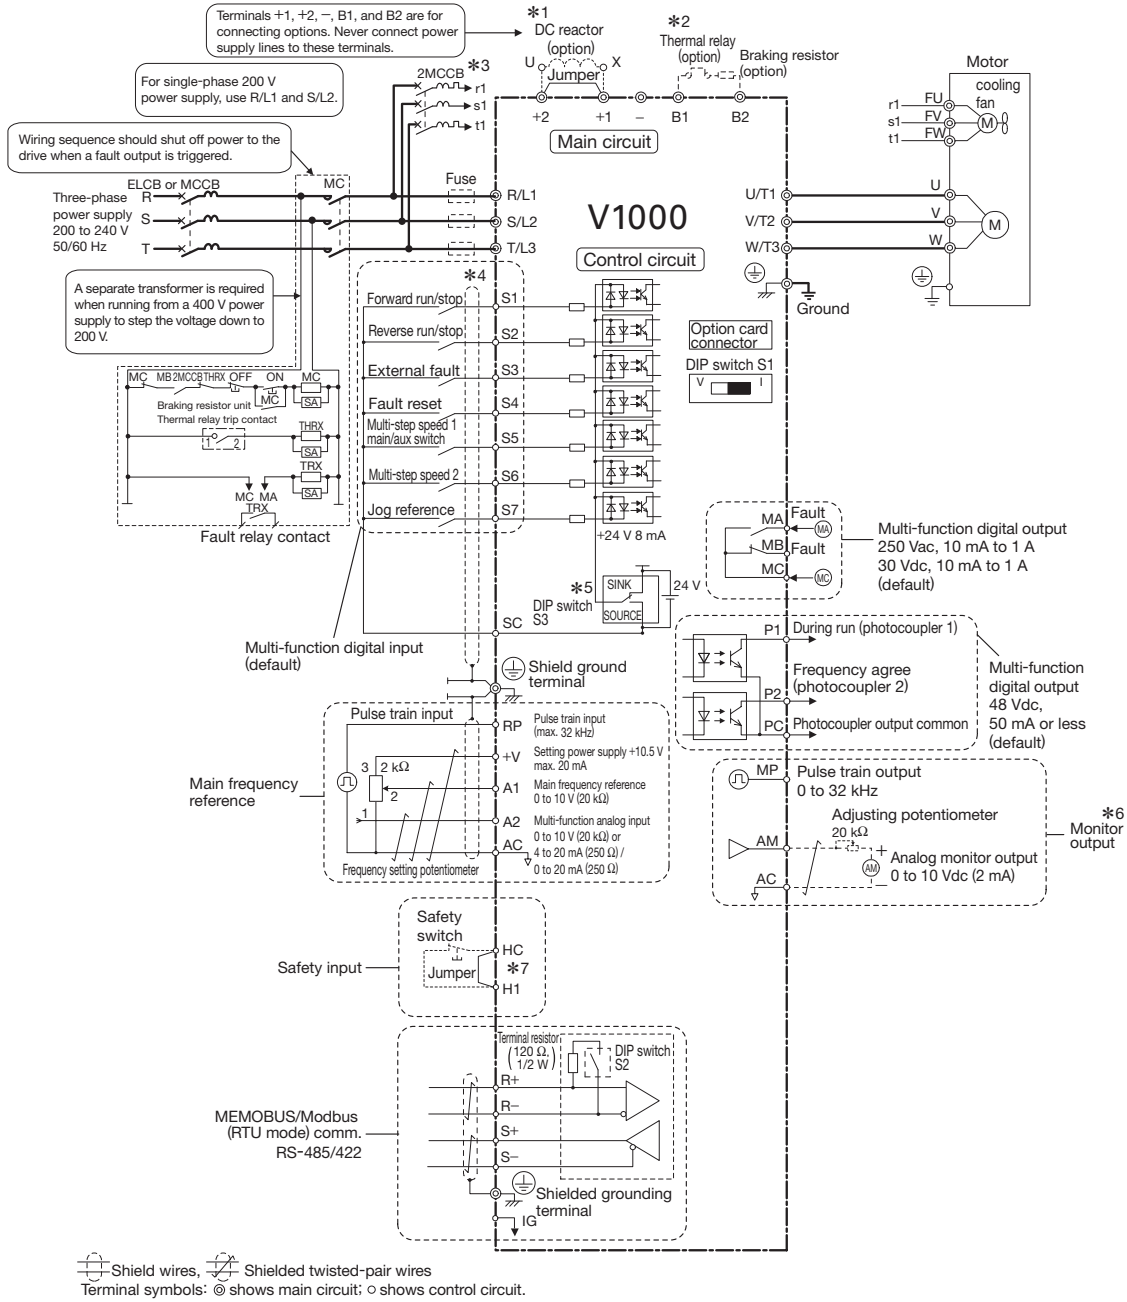

- Low resistance to ground from the motor cable or terminal block.
- Drive already has a short-circuit when the power is turned on.

Standard Connection Diagram

Standard Connection Diagram

Example: 200 V Class

- *1: Remove the jumper between terminals +1 and +2 when installing an optional DC reactor.
 - *2: The MC on the input side of the main circuit should open when the thermal relay is triggered.
 - *3: Self-cooled motors do not require separate cooling fan motor wiring.
 - *4: Connected using sequence (0 V com/sink mode) input signal (S1 to S7) from NPN transistor (default).
 - *5: Sinking mode requires an internal 24 V power supply. Source mode requires an external power supply.
 - *6: Monitor outputs work with devices such as analog frequency meters, current meters, voltmeters and watt meters. They cannot be used in a control system requiring feedback.
 - *7: When using an external switch to stop the drive as a safety precaution, make sure the jumper creating the short circuit has been removed. Output is interrupted within 1 ms after the safety input is triggered. Make sure safety input wiring does not exceed 30 m.
- Note: Input terminal functions may change when Application Presets are used.

Terminal Functions

Main Circuit Terminals

Terminal	Terminal Name	Function (Signal Level)
R/L1	Main circuit power supply input	Connects line power to the drive. Drives with single-phase 200 V input power use terminals R/L1 and S/L2 only (do not use T/L3).
S/L2		
T/L3		
U/T1	Drive output	Connects to the motor.
V/T2		
W/T3		
B1	Braking resistor / Braking resistor unit	Available for connecting a braking resistor or braking resistor unit.
B2		
+1	DC reactor connection	These terminals are shorted for shipment. Remove the jumper creating the short to install a DC choke.
+2		
+1		
–	DC power supply input	For connecting a DC power supply. DC power supply input terminals (+1, –) are not UL/cUL and CE certified.
⊕ Two terminals		
Ground		Grounding terminal Grounding resistance for 200 V class: 100 Ω or less Grounding resistance for 400 V class: 10 Ω or less

Fully-Enclosed Design and Watt Loss Data

The Open Chassis type drive can be installed in a fully-enclosed panel.

An open chassis model in a protective enclosure with the heatsink inside the panel allows for intake air temperature up to 50°C. The heatsink can alternatively be mounted outside the control panel, thus reducing the amount of heat inside the panel and allowing for a more compact set up. Be sure to leave enough clearance during installation for ventilation and proper cooling as well as access to wiring for maintenance.

*: The Enclosure Panel type models (CIMR-VA2A0030 to 0069, CIMR-VA4A0018 to 0038) can be installed with the top and bottom covers removed.

Note: An attachment (option) is required to install the heatsink outside the enclosure. Refer to the following page.

Peripheral Devices and Options

Name	Purpose	Model, Manufacturer	Page
Ground Fault Interrupter (GFI)	Always install a GFI on the power-supply side to protect the power supply system and to prevent an overload at the occurrence of short-circuit, and to protect the drive from ground faults that could result in electric shock or fire. Note: When a GFI is installed for the upper power supply system, an MCCB can be used instead of a GFI. (Choose a GFI designed to minimize harmonics specifically for AC drives. Use one GFI per drive, each with a current rating of at least 30 mA.)	Recommended: NV series by Mitsubishi Electric	p.30
Circuit Breaker	Always install a circuit breaker on the power-supply side to protect the power supply system and to prevent an overload at the occurrence of a short-circuit.	Recommended: NF series by Mitsubishi Electric	p.30
Magnetic Contactor	Interrupts the power supply to the drive. In addition to protecting drive circuitry, a magnetic contactor also prevents damage to a braking resistor if used.	Recommended: SC series by Fuji Electric	p.31
Surge Protector	Absorbs the voltage surge from switching of electro-magnetic contactors and control relays. Install a surge protector to the magnetic contactors and control relays as well as magnetic valves and magnetic braking coil.	DCR2 series RFN series by Nippon Chemi-Con Corporation	p.31
DC Reactor	Used for harmonic current suppression and total improving power factor.	UZDA series	p.32, 33
AC Reactor	Should be used if the power supply capacity is larger than 600 kVA.	UZBA series	p.34, 35
Zero Phase Reactor	Reduces noise from the line that enters into the drive input power system. Should be installed as close as possible to the drive. Can be used on both the input and output sides.	F6045GB F11080GB by Hitachi Metals, Ltd.	p.36
Fuse / Fuse Holder	Protects internal circuitry in the event of component failure. Fuse should be connected to the input terminal of the drive. Note: Refer to the instruction manual for information on UL approval.	CR6L series CMS series by Fuji Electric	p.37
Capacitor-type Noise Filter	Reduces noise from the line that enters into the drive input power system. The noise filter can be used in combination with a zero-phase reactor. Note: Available for drive input only. Do not connect the noise filter to the output terminals.	3XYG 1003 by Okaya Electric Industries	p.37
Input Noise Filter	Reduces noise from the line that enters into the drive input power system. Should be installed as close as possible to the drive.	LNFD series LNFB series FN series For CE Marking (EMC Directive) compliant models, refer to V1000 Technical Manual.	p.38, 39
Output Noise Filter	Reduces noise from the line that enters into the drive input power system. Should be installed as close as possible to the drive.	LF series by NEC TOKIN Corporation	p.40
Isolator	Isolates the drive I/O signal, and is effective in reducing inductive noise.	DGP2 series	p.41
Braking Resistor	Used to shorten the deceleration time by dissipating regenerative energy through a resistor. (3% ED)	ERF150WJ series CF120-B579 series	p.42, 43
Braking Resistor Unit	Used to shorten the deceleration time by dissipating regenerative energy through a resistor. A thermal overload relay is built in. (10% ED)	LKEB series	p.42, 43
24 V Power Supply	Provides power supply for the control circuit and option boards. Note: Parameter settings cannot be changed when the drive is operating solely from this power supply.	PS-V10S PS-V10M	p.44
USB Copy Unit (RJ-45/USB compatible plug)	· Adapter for connecting the drive to the USB port of a PC. · Can copy parameter settings to be later transferred to another drive.	JVOP-181	p.45

Ground Fault Interrupter, Circuit Breaker

Base device selection on motor capacity. Make sure that the rated breaking capacity is higher than the shortcircuit current for the power supply. Protect the wiring to withstand the short-circuit current for the power supply using a combination of fuses if the rated breaking capacity of the circuit breaker or ground fault interrupter is insufficient, such as when the power transformer capacity is large.

Base device selection on motor capacity.

Connection Diagram

Note: When using low noise type drives (high-carrier frequency of 2.5 kHz or more), do not connect an AC reactor to the output side (U, V, W) of the drive.

For use with an AC power supply see the connection diagram on page 22.

Note: When connecting multiple drives together, make sure that each drive has its own fuse. If any one fuse blows, all fuses should be replaced.

Capacitor-type Noise Filter

Capacitor-type noise filter exclusively designed for drive input. The noise filter can be used in combination with a zero-phase reactor. For both 200 V and 400 V classes.

Note: The capacitor-type noise filter can be used for drive input only. Do not connect the noise filter to the output terminals.

Note: Contact Yaskawa for CE compliant models (EMC directive).

Connection Diagram

Connecting Noise Filters in Parallel to the Input or Output Side (examples shows two filters in parallel)

Note: When wiring contactors in parallel, make sure wiring lengths are the same to keep current flow even to the relay terminals. Noise filters and grounding wire should be as heavy and as short as possible.

Note: Do not connect the input noise filter to the drive output terminals (U, V, W). Connect in parallel when using two filters. Only a single noise filter is required if the filter is made by Schaffner Elektronik AG.

Set parameter L8-01 to 1 (resistor overheat protection enabled). And, set one of the multi-function digital output terminals (H2-□□) to D (braking resistor fault). With this setting, A sequence in which the power supply will be shut off is required. (When using a braking resistor with fuse, an external sequence is not required)

Connection Diagram A

Connection Diagram B

- *1: Disable Stall Prevention during deceleration by setting L3-04 (Stall Prevention Selection during Deceleration) to 0 (Disabled) when using a Braking Resistor or Braking Resistor Unit. The motor may not stop within the deceleration time if this setting is not changed from 1 (Enabled: default).
- *2: Set L8-01 to 1 to enable braking resistor overload protection in the drive when using ERF-type resistors.
- *3: Be sure to protect non-Yaskawa braking resistors by thermal overload relay.

- Note: 1. For connections of the separate type braking unit (CDBR type) without using the built-in braking transistor, connect the B1 terminal of the drive to the + terminal of the braking resistor unit and connect the - terminal of the drive to the - terminal of the braking resistor unit. The B2 terminal is not used in this case.
2. Multiple braking resistors should be connected in parallel.

*1: Refers to a motor coasting to stop with a constant torque load. Constant output and regenerative braking will reduce the duty factor.
 *2: The braking unit should have a resistance higher than the minimum connectable resistance value and be able to generate enough braking torque to stop the motor.
 *3: Applications with a relatively large amount of regenerative power (elevators, hoists, etc.) may require more braking power than is possible with only the standard braking unit and braking resistor. If the braking torque exceeds the value shown in the table, a braking resistor of a higher capacity must be selected.
 Note: If the built-in fuse on a braking resistor blows, then the entire braking resistor should be replaced.

Peripheral Devices and Options (continued)

24 V Power Supply

The 24 V Power Supply Option maintains drive control circuit power in the event of a main power outage. The control circuit keeps the network communications and I/O data operational in the event of a power outage. It supplies external power to the control circuit only.

Note: Parameter settings can be accessed but cannot be changed when the drive is operating solely from this power supply.

The installed option adds 34 mm to the total depth of the drive.

Connection Diagram

- Note: 1. This cable with "white" connector ends is supplied with the PS-V10M Option.
 2. This cable with "black" connector ends is supplied with the PS-V10S Option.

The mounting support bracket is required for UL Type 1. If these supports are not used, the design is considered "Open Type."

● USB Copy Unit (Model: JVOP-181)

Copy parameter settings in a single step, then transfer those settings to another drive.
Connects to the RJ-45 port on the drive and to the USB port of a PC.

Connection

Model	Code No.
JVOP-181	100-038-281

Note: JVOP-181 is a set consisting of a USB copy unit, RJ-45 cable, and USB cable.

Specifications

Item	Specifications	
Port	LAN (RJ-45) : Connect to the drive.	
	USB (Ver.2.0 compatible) : Connect to the PC as required.

Operating System	OS compatible with 32-bit memory	Windows 2000
	OS compatible with 32-bit and 64-bit memory	Windows XP
Memory	Memorizes the parameters for one drive.	
Dimensions	30 (W) × 80 (H) × 20 (D) mm	
Included	RJ-45 cable (1 m), USB cable (30 cm)	

- Note: 1. Drives must have identical software versions to copy parameters settings.
2. Requires a USB driver.
You can download the driver for free from Yaskawa's product and technical information website (<http://www.e-mechatronics.com>).
3. Parameter copy function disabled when connected to a PC.

PC USB Connector

- Note: 1. You can also use a commercially available USB 2.0 cable (with A-B connectors) for the USB cable.
2. No USB cable is needed to copy parameters to other drives.

● PC Cable (Model: WV103)

Cable to connect the drive to a PC with DriveWizard Plus or DriveWorksEZ installed.

Connection

Model	Code No.
WV103	WV103

Specifications

Item	Specifications
Connector	DSUB9P
Cable Length	3 m

- Note: 1. The USB Copy Unit is required to when using a USB cable to connect the drive to a PC.
2. DriveWizard Plus is a PC software package for managing parameters and functions in Yaskawa drives. To order this software, contact your YASKAWA representative.
DriveWorksEZ is the software for creating custom application programs for the drive through visual programming. To order this software, contact our sales representative.

● Application Notes

Selection

■ Installing a Reactor

An AC or DC reactor can be used for the following:

- to suppress harmonic current.
- to smooth peak current that results from capacitor switching.
- when the power supply is above 600 kVA.
- Use an AC reactor when also connecting a thyristor converter to the same power supply system, regardless of the conditions of the power supply.

■ Drive Capacity

Make sure that the motor's rated current is less than the drive's output current. When running a specialized motor or more than one motor in parallel from a single drive, the capacity of the drive should be larger than 1.1 times of the total motor rated current.

■ Starting Torque

The overload rating for the drive determines the starting and accelerating characteristics of the motor. Expect lower torque than when running from line power. To get more starting torque, use a larger drive or increase both the motor and drive capacity.

■ Emergency Stop

When the drive faults out, a protective circuit is activated and drive output is shut off. This, however, does not stop the motor immediately. Some type of mechanical brake may be needed if it is necessary to halt the motor faster than the Fast Stop function is able to.

■ Options

She B1, B2, -, +1, and +2 terminals are used to connect optional devices. Connect only V1000-compatible devices.

■ Repetitive Starting/Stopping

Cranes (Hoists), elevators, punching presses, and other such applications with frequent starts and stops often exceed 150% of their rated current values. Heat stress generated from repetitive high current can shorten the lifespan of the IGBTs. The expected lifespan for the IGBTs is about 8 million start and stop cycles with a 4 kHz carrier frequency and a 150% peak current.

Yaskawa recommends lowering the carrier frequency, particularly when audible noise is not a concern. The user can also choose to reduce the load, increase the acceleration and deceleration times, or switch to a larger drive. This will help keep peak current levels under 150%. Be sure to check the peak current levels when starting and stopping repeatedly during the initial test run, and make adjustments accordingly.

For crane-type applications taking the inching function in which the motor is quickly started and stopped, Yaskawa recommends the following to ensure motor torque levels and lower the drive:

- Select a large enough drive so that peak current levels remain below 150%.
- The drive should be one frame size larger than the motor.

Installation

■ Enclosure Panels

Keep the drive in a clean environment by either selecting an area free of airborne dust, lint, oil mist, corrosive gas, and flammable gas, or install the drive in an enclosure panel. Leave the required space between the drives to provide for cooling, and take steps to ensure that the ambient temperature remains within allowable limits. Keep flammable materials away from the drive. If the drive must be used in an area where it is subjected to oil mist and excessive vibration, protective designs are available. Contact Yaskawa for details.

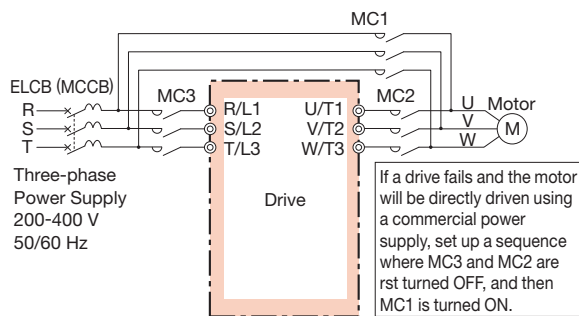

■ Installation Direction

The drive should be installed upright as specified in the manual.

■ Installation of Bypass Circuit

If the fuse blows or the circuit breaker (MCCB) trips, check the cable wiring and selection of peripheral devices and identify the cause. If the cause cannot be identified, do not turn ON the power supply or operate the device. Contact your Yaskawa representative.

If a drive fails and the motor will be directly driven using a commercial power supply, install the bypass circuit shown in the diagram below. If this bypass circuit is not installed, remove the drive and then connect the motor to a commercial power supply. (In other words, after disconnecting the cables connected to the main circuit terminals, such as main circuit power supply input terminals R/L1, S/L2, and T/L3 and drive output terminals U/T1, V/T2, and W/T3, connect the motor to a commercial power supply.)

Settings

- If using Open Loop Vector Control designed for permanent magnet motors, make sure that the proper motor code has been set to parameter E5-01 before performing a trial run.
- Upper Limits

Because the drive is capable of running the motor at up to 400 Hz, be sure to set the upper limit for the frequency to control the maximum speed. The default setting for the maximum output frequency is 60 Hz.
- DC Injection Braking

Motor overheat can result if there is too much current used during DC Injection Braking, or if the time for DC Injection Braking is too long.
- Acceleration/Deceleration Times

Acceleration and deceleration times are affected by how much torque the motor generates, the load torque, and the inertia moment ($GD^2/4$). Set a longer accel/decel time when Stall Prevention is enabled. The accel/decel times are lengthened for as long as the Stall Prevention function is operating. For faster acceleration and deceleration, increase the capacity of the drive.

Compliance with Harmonic Suppression Guidelines

V1000 conforms to strict guidelines in Japan covering harmonic suppression for power conversion devices. Defined in JEM-TR201 and JEM-TR226 and published by the Japan Electrical Manufacturers' Association, these guidelines define the amount of harmonic current output acceptable for new installation. Contact your YASKAWA representative.

General Handling

■ Wiring Check

Never short the drive output terminals or apply voltage to output terminals (U/T1, V/T2, W/T3), as this can cause serious damage to the drive. Doing so will destroy the drive. Be sure to perform a final check of all sequence wiring and other connections before turning the power on. Make sure there are no short circuits on the control terminals (+V, AC, etc.), as this could damage the drive.

■ Magnetic Contactor Installation

Avoid switching a magnetic contactor on the power supply side more frequently than once every 30 minutes. Frequent switching can cause damage to the drive.

■ Inspection and Maintenance

After shutting off the drive, make sure the CHARGE light has gone out completely before performing any inspection or maintenance. Residual voltage in drive capacitors can cause serious electric shock.

The heatsink can become quite hot during operation, and proper precautions should be taken to prevent burns. When replacing the cooling fan, shut off the power and wait at least 15 minutes to be sure that the heatsink has cooled down.

■ Transporting the Drive

Never steam clean the drive.

During transport, keep the drive from coming into contact with salts, fluorine, bromine and other such harmful chemicals.

● Peripheral Devices

■ Installing a Ground Fault Interrupter or an MCCB

Install an MCCB or a ground fault interrupter recommended by Yaskawa to the power supply side of the drive to protect internal circuitry. The type of MCCB needed depends on the power supply power factor (power supply voltage, output frequency, load characteristics, etc.). Sometimes a fairly large MCCB may be required due to the effects of harmonic current on operating characteristics. Those using a ground fault interrupter other than those recommended in this catalog, use one fitted for harmonic suppression measures (one designed specifically for drives). The rated current of the ground fault interrupter must be 200 mA or higher per drive unit. Select an MCCB with a rated capacity greater than the short-circuit current for the power supply. For a fairly large power supply transformer, a fuse can be added to the ground fault interrupter or MCCB in order to handle the short-circuit current level.

■ Magnetic Contactor for Input Power

Use a magnetic contactor (MC) to ensure that power to the drive can be completely shut off when necessary.

The MC should be wired so that it opens when a fault output terminal is tripped.

Even though an MC is designed to switch following a momentary power loss, frequent MC use can damage other components. Avoid switching the MC more than once every 30 minutes. The MC will not be activated after a momentary power loss if using the operator keypad to run the drive. This is because the drive is unable to restart automatically when set for LOCAL. Although the drive can be stopped by using an MC installed on the power supply side, the drive cannot stop the motor in a controlled fashion, and it will simply coast to stop. If a braking resistor or dynamic braking unit has been installed, be absolutely sure to set up a sequence that opens the MC with a thermal protector switch connected to the braking resistor device.

■ Magnetic Contactor for Motor

As a general principle, the user should avoid opening and closing the magnetic contactor between the motor and the drive during run. Doing so can cause high peak currents and overcurrent faults. If magnetic contactors are used to bypass the drive by connecting the motor to the power supply directly, make sure to close the bypass only after the drive is stopped and fully disconnected from the motor. The Speed Search function can be used to start a coasting motor.

Use an MC with delayed release if momentary power loss is a concern.

■ Motor Thermal Over Load Relay Installation

Although the drive comes with built in electrothermal protection to prevent damage from overheat, a thermal relay should be connected between the drive and each motor if running several motors from the same drive. For a multipole motor or some other type of non-standard motor, Yaskawa recommends using an external thermal relay appropriate for the motor. Be sure to disable the motor protection selection parameter (L1-01 = 0), and set the thermal relay or thermal protection value to 1.1 times the motor rated current listed on the motor nameplate.

When a high carrier frequency and long motor cables are used, nuisance tripping of the thermal relay may occur due to increased leakage current. To avoid this, reduce the carrier frequency or increase the tripping level of the thermal overload relay.

■ Improving the Power Factor

Installing a DC or AC reactor to the input side of the drive can help improve the power factor.

Refrain from using a capacitor or surge absorber on the output side as a way of improving the power factor, because high-frequency contents on the output side can lead to damage from overheat. This can also lead to problems with overcurrent.

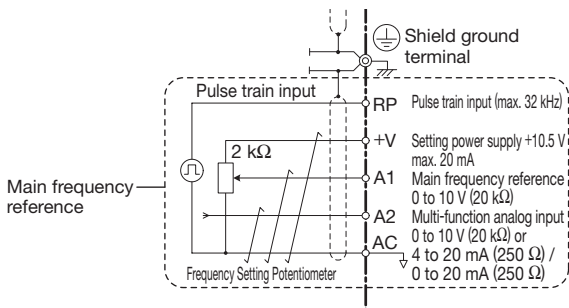

■ Radio Frequency Interference

Drive output contains high-frequency contents that can affect the performance of surrounding electronic instruments such as an AM radio. These problems can be prevented by installing a noise filter, as well as by using a properly grounded metal conduit to separate wiring between the drive and motor.

■ Wire Gauges and Wiring Distance

Motor torque can suffer as a result of voltage loss across a long cable running between the drive and motor, especially when there is low frequency output. Make sure that a large enough wire gauge is used.

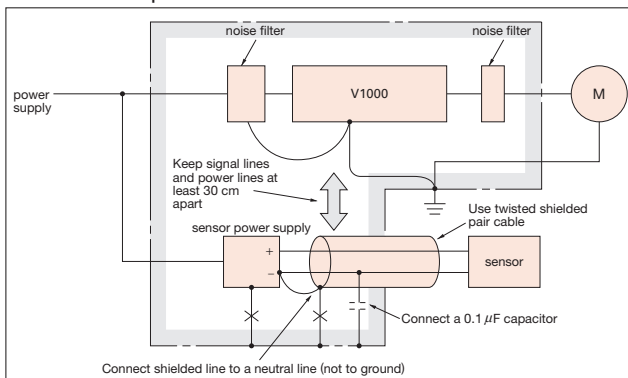

The optional LCD operator requires a proprietary cable to connect to the drive. If an analog signal is used to operate the drive via the input terminals, make sure that the wire between the analog operator and the drive is no longer than 50 m, and that it is properly separated from the main circuit wiring. Use reinforced circuitry (main circuit and relay sequence circuitry) to prevent inductance from surrounding devices. To run the drive with a frequency potentiometer via the external terminals, use twisted shielded pair cables and ground the shield.

■ Counteracting Noise

Because V1000 is designed with PWM control, a low carrier frequency tends to create more motor flux noise than using a higher carrier frequency. Keep the following point in mind when considering how to reduce motor noise:

- Lowering the carrier frequency (C6-02) minimizes the effects of noise.
- A line noise filter can be effective in reducing the affects on AM radio frequencies and poor sensor performance. See "Options and Peripheral Devices" on page 28.
- Make sure the distance between signal and power lines is at least 10 cm (up to 30 cm is preferable), and use twisted pair cable to prevent induction noise form the drive power lines.

<Provided by JEMA>

■ Leakage Current

High-frequency leakage current passes through stray capacitance that exists between the power lines to the drive, ground, and the motor lines. Consider using the following peripheral devices to prevent problems with leakage current.

	Problem	Solution
Ground Leakage Current	MCCB is mistakenly triggered	<ul style="list-style-type: none"> • Lower the carrier frequency set to parameter C6-02. • Try using a component designed to minimize harmonic distortion for the MCCB such as the NV series by Mitsubishi.
Current Leakage Between Lines	Thermal relay connected to the external terminals is mistakenly triggered by harmonics in the leakage current	<ul style="list-style-type: none"> • Lower the carrier frequency set to parameter C6-02. • Use the drive's built-in thermal motor protection function.

The following table shows the guidelines for the set value of the carrier frequency relative to the wiring distance between the drive and the motor when using V/f control.

When Open Loop Vector Control or PM Open Loop Vector Control is used and the wiring distance is 50 m to 100 m, set the carrier frequency to 2 kHz.

Wiring Distance*	50 m or less	100 m or less	Greater than 100 m
C6-02: Carrier Frequency Selection	1 to Auto (15 kHz or less)	1, 2, 7 to Auto (5 kHz or less)	1, 7 to Auto (2 kHz or less)

*: When a single drive is used to run multiple motors, the length of the motor cable should be calculated as the total distance between the drive and each motor.

When the wiring distance exceeds 100 m, use the drive observing the following conditions.

- Select V/f control mode (A1-02=0)
- To start a coasting motor
 - a) Use the current detection type (b3-24=0) when using the speed search function, or
 - b) Set the DC injection braking time at start (b2-03=0.01 to 10.00 sec) to stop a coasting motor and restart it.

More than one synchronous motor cannot be connected to a single drive. The maximum wiring distance between the drive and the synchronous motor must be 100 m.

Notes on Motor Operation

Motor Bearing Life

In applications involving constant speed over long periods, such as fans, pumps, extruders, and textile machinery, the life of the motor bearing may be shortened. This is called bearing electrolytic corrosion.

The installation of a zero-phase reactor between the drive and motor, and the utilization of a motor with insulated bearings are effective countermeasures.

Details can be found in the technical documentation.

Contact your Yaskawa or nearest sales representative for more information.

Using a Standard Motor

Low Speed Range

There is a greater amount of loss when operating a motor using an drive than when running directly from line power. With a drive, the motor can become quite hot due to the poor ability to cool the motor at low speeds. The load torque should be reduced accordingly at low speeds. The figure above shows the allowable load characteristics for a Yaskawa standard motor. A motor designed specifically for operation with a drive should be used when 100% continuous torque is needed at low speeds.

Insulation Tolerance

Consider voltage tolerance levels and insulation in applications with an input voltage of over 440 V or particularly long wiring distances.

High Speed Operation

Problems may occur with the motor bearings and dynamic balance in applications operating at over 60 Hz. Contact Yaskawa for consultation.

Torque Characteristics

Torque characteristics differ when operating directly from line power. The user should have a full understanding of the load torque characteristics for the application.

Vibration and Shock

V1000 lets the user choose between high carrier PWM control and low carrier PWM. Selecting high carrier PWM can help reduce motor oscillation. Keep the following points in mind when using high carrier PWM:

(1) Resonance

Take particular caution when using a variable speed drive for an application that is conventionally run from line power at a constant speed. Shock-absorbing rubber should be installed around the base of the motor and the Jump Frequency selection should be enabled to prevent resonance.

(2) Any imperfection on a rotating body increases vibration with speed

Caution should be taken when operating above the motor rated speed.

Audible Noise

Noise created during run varies by the carrier frequency setting. Using a high carrier frequency creates about as much noise as running from line power. Operating above the rated r/min (i.e., above 60 Hz), however, can create unpleasant motor noise.

Using a Synchronous Motor

- Please contact us for consultation when using a synchronous motor not already approved by Yaskawa.
- Even when the power has been shut off for a drive running a PM motor, voltage continues to be generated at the motor terminals while the motor coasts to stop. Take the precautions described below to prevent shock and injury:
 - Applications where the machine can still rotate even though the drive has fully stopped should have a low voltage manual load switch installed to the output side of the drive. (Yaskawa recommends the AICUT LB Series by AICHI Electric Works Co., Ltd.)
 - Do not apply to a load that could potentially rotate the motor faster than the maximum allowable r/min even when the drive has been shut off.
 - Wait at least one minute after opening the low voltage manual load switch on the output side before inspecting the drive or performing and maintenance.
 - Do not open a close the low voltage manual load switch while the motor is running, as this can damage the drive.
 - To close the low voltage manual load switch connected to a coasting motor, first turn on the power to the drive and make sure that the drive has stopped.
- Synchronous motors cannot be started directly from line power. Applications that requiring line power to start should use an induction motor with the drive.
- A single drive is not capable of running multiple synchronous motors at the same time. Use a standard induction motor for such setups.
- At start, a synchronous motor may rotate slightly in the opposite direction of the Run command depending on parameter settings and motor type.
- Uses derated torque of 50% less than starting torque. Set up the motor with the drive after verifying the starting torque, allowable load characteristics, impact load tolerance, and speed control range.
- Even with a braking resistor, braking torque is less than 125% when running between 20% to 100% speed, and falls to less than half the braking torque when running at less than 20% speed.
- There is no torque control available, and torque limits cannot be set. Consequently, synchronous motors are not appropriate for applications that operate at low speeds (less than 10% of the rated speed) or experience sudden changes in speed. Such applications are better suited for induction motors or servo drives.
- The allowable load inertia moment is 50 times less than the motor inertia moment. Contact Yaskawa concerning applications with a larger inertia moment.
- When using a holding brake, release the brake prior to starting the motor. Failure to set the proper timing can result in speed loss. Not for use with conveyor, transport, or hoist type applications.
- To restart a coasting motor rotating at over 120 Hz, use the Short Circuit Braking* function to first bring the motor to a stop. Short Circuit Braking requires a special braking resistor. Speed Search can be used to restart a coasting motor rotating slower than 120 Hz. If the motor cable is relatively long, however, the motor should instead be stopped using Short Circuit Braking and then restarted.
 - *: Short Circuit Braking creates a short-circuit in the motor windings to forcibly stop a coasting motor.

● Applications with Specialized Motors

■ Multi-pole Motor

Because the rated current will differ from a standard motor, be sure to check the maximum current when selecting a drive. Always stop the motor before switching between the number of motor poles. If a regenerative overvoltage fault occurs or if overcurrent protection is triggered, the motor will coast to stop.

■ Submersible Motor

Because motor rated current is greater than a standard motor, select the drive capacity accordingly. Be sure to use a large enough motor cable to avoid decreasing the maximum torque level on account of voltage drop caused by a long motor cable.

■ Explosion-proof Motor

Both the motor and drive need to be tested together to be certified as explosion-proof. The drive is not for explosion proof areas.

■ Geared Motor

Continuous operation specifications differ by the manufacturer of the lubricant. Due to potential problems of gear damage when operating at low speeds, be sure to select the proper lubricant. Consult with the manufacturer for applications that require speeds greater than the rated speed range of the motor or gear box.

■ Single-phase Motor

Variable speed drives are not designed for operating single phase motors. Using a capacitor to start the motor causes high-frequency current to flow into the capacitors, potentially causing damage. A split-phase start or a repulsion start can end up burning out the starter coils because the internal centrifugal switch is not activated. V1000 is for use only with 3-phase motors.

■ Uras Vibrator

Uras vibrator is a vibration motor that gets power from centrifugal force by rotating unbalanced weights on both ends of the shaft. Make the following considerations when selecting a drive for use with an Uras vibrator:

- (1) Uras vibrator should be used within the drive rated frequency
- (2) Use V/f Control
- (3) Increase the acceleration time five to fifteen times longer than would normally be used due to the high amount of load inertia of an Uras vibrator

Note: A drive with a different capacity must be selected if the acceleration time is less than 5 s.

- (4) Drive may have trouble starting due to undertorque that results from erratic torque (static friction torque at start)

■ Motor with Brake

Caution should be taken when using a drive to operate a motor with a built-in holding brake. If the brake is connected to the output side of the drive, it may not release at start due to low voltage levels. A separate power supply should be installed for the motor brake. Motors with a built-in brake tend to generate a fair amount of noise when running at low speeds.

Power Driven Machinery (decelerators, belts, chains, etc.)

Continuous operation at low speeds wears on the lubricating material used in gear box type systems to accelerate and decelerate power driven machinery. Caution should also be taken when operating at speeds above the rated machine speed due to noise and shortened performance life.

● Warranty Information

■ Warranty Period

The period is 12 months from the date the product is first used by the buyer, or 18 months from the date of shipment, whichever occurs first.

■ Post-Warranty Repair Period

The post-warranty repair period applies to products that are not in the standard warranty period.

During the post-warranty repair period, Yaskawa will repair or replace damaged parts for a fee.

There is a limit to the period during which Yaskawa will repair or replace damaged parts.

Contact Yaskawa or your nearest sales representative for more information.

■ Warranty Scope

Failure diagnosis

The primary failure diagnosis shall be performed by your company as a rule.

By your company's request, however, we or our service sector can execute the work for your company for pay.

In such a case, if the cause of the failure is in our side, the work is free.

Repair

When a failure occurred, repairs, replacement, and trip to the site for repairing the product shall be free of charge.

However, the following cases have to be paid.

- Cases of failure caused by inappropriate storing, handling, careless negligence, or system design errors performed by you or your customers.
- Cases of failure caused by a modification performed by your company without our approval.
- Cases of failure caused by using the product beyond the specification range.
- Cases of failure caused by force majeure such as natural disaster and fire.
- Cases in which the warranty period has expired.
- Cases of replacement of consumables and other parts with limited service life.
- Cases of product defects caused by packaging or fumigation processing.
- Cases of malfunction or errors caused by programs created by you using DriveWorksEZ.
- Other failures caused by reasons for which Yaskawa is not liable.

The services described above are available in Japan only. Please understand that failure diagnosis is not available outside of Japan. If overseas after-sales service is desired, consider registering for the optional overseas after-sales service contract.

Exception of Guaranteed Duty

Lost business opportunities and damage to your property, including your customers and other compensation for work, is not covered by the warranty regardless of warranty eligibility, except when caused by product failure of Yaskawa products.

■ Definition of Delivery

For standard products that are not set or adjusted for a specified application, Yaskawa considers the product delivered when it arrives at your company and Yaskawa is not responsible for on-site adjustments or test runs.
